# **Qtile Documentation**

Release 0.23.1.dev0+g76def02.d20230924

**Aldo Cortesi** 

Sep 24, 2023

# **GETTING STARTED**

1	Installation	3
2	Running Qtile as a Wayland Compositor	11
3	Troubleshooting	15
4	Entry points	17
5	Architecture	27
6	Interfaces	35
7	Commands API	39
8	Default Config File	181
9	The config file	187
10	Built-in Layouts	213
11	Built-in Widgets	231
12	Built-in Hooks	319
13	Built-in Extensions	331
14	Keybindings in images	337
15	Window stacking	341
16	Hacking on Qtile	343
17	Contributing	349
18	Frequently Asked Questions	353
19	How to create a widget	359
20	Using git	373
21	License	377
22	Changelog	379

Index

Qtile is a full-featured, hackable tiling window manager written and configured in Python. It's available both as an X11 window manager and also as *a Wayland compositor*.

This documentation is designed to help you *install* and *configure* Qtile. Once it's up and running you'll probably want to start adding your own *customisations* to have it running exactly the way you want.

You'll find a lot of what you need within these docs but, if you still have some questions, you can find support in the following places:

#### IRC

irc://irc.oftc.net:6667/qtile

#### Discord

https://discord.gg/ehh233wCrC (Bridged with IRC)

#### Q&A

https://github.com/qtile/qtile/discussions/categories/q-a

#### **Mailing List**

https://groups.google.com/group/qtile-dev

### CHAPTER

### ONE

# **INSTALLATION**

### **1.1 Distro Guides**

Below are the preferred installation methods for specific distros. If you are running something else, please see *Installing From Source*.

### 1.1.1 Installing on Arch Linux

Stable versions of Qtile are currently packaged for Arch Linux. To install this package, run:

pacman -S qtile

Please see the ArchWiki for more information on Qtile.

### 1.1.2 Installing on Fedora

Stable versions of Qtile are not currently packaged for the current version of Fedora. Users are advised to follow the instructions of *Installing From Source*.

### 1.1.3 Installing on Funtoo

Latest versions of Qtile are available on Funtoo. To install it, run:

emerge -av x11-wm/qtile

You can also install the development version from GitHub:

```
echo "x11-wm/qtile-9999 **" >> /etc/portage/package.accept_keywords
emerge -av qtile
```

#### Customize

You can customize your installation with the following useflags:

- dbus
- widget-khal-calendar
- widget-imap
- widget-keyboardkbdd
- widget-launchbar
- widget-mpd
- widget-mpris
- widget-wlan

The dbus useflag is enabled by default. Disable it only if you know what it is and know you don't use/need it.

All widget-\* useflags are disabled by default because these widgets require additional dependencies while not everyone will use them. Enable only widgets you need to avoid extra dependencies thanks to these useflags.

Visit Funtoo Qtile documentation for more details on Qtile installation on Funtoo.

### 1.1.4 Installing on Debian or Ubuntu

To install the latest stable version of Qtile on Ubuntu (newer than 20.04) and Debian 9:

pip install xcffib pip install qtile

To install the git version see Installing From Source

Note: As of Ubuntu 20.04 (Focal Fossa), the package has been outdated and removed from the Ubuntu's official package list.

#### Debian 11 (bullseye)

Debian 11 comes with the necessary packages for installing Qtile. Starting from a minimal Debian installation, the following packages are required:

```
sudo apt install xserver-xorg xinit
sudo apt install libpangocairo-1.0-0
sudo apt install python3-pip python3-xcffib python3-cairocffi
```

Either Qtile can then be downloaded from the package index or the Github repository can be used, see *Installing From Source*:

pip install qtile

### 1.1.5 Installing on Slackware

Qtile is available on the SlackBuilds.org as:

Package Name	Description		
qtile	stable branch (release)		

#### Using slpkg (third party package manager)

The easy way to install Qtile is with slpkg. For example:

slpkg -s sbo qtile

#### **Manual installation**

Download dependencies first and install them. The order in which you need to install is:

- pycparser
- cffi
- futures
- python-xcffib
- trollius
- cairocffi
- qtile

Please see the HOWTO for more information on SlackBuild Usage HOWTO.

### 1.1.6 Installing on FreeBSD

Qtile is available via FreeBSD Ports. It can be installed with

pkg install qtile

### 1.1.7 Installing on NixOS

Qtile is available in the NixOS repos. To set qtile as your window manager, include this in your configuration.nix file:

```
services.xserver.windowManager.qtile.enable = true;
```

# **1.2 Installing From Source**

### 1.2.1 Python interpreters

We aim to always support the last three versions of CPython, the reference Python interpreter. We usually support the latest stable version of PyPy as well. You can check the versions and interpreters we currently run our test suite against in our tox configuration file.

There are not many differences between versions aside from Python features you may or may not be able to use in your config. PyPy should be faster at runtime than any corresponding CPython version under most circumstances, especially for bits of Python code that are run many times. CPython should start up faster than PyPy and has better compatibility for external libraries.

### **1.2.2 Core Dependencies**

Here are Qtile's core runtime dependencies and the package names that provide them in Ubuntu. Note that Qtile can run with one of two backends -- X11 and Wayland -- so only the dependencies of one of these is required.

Dependency	Ubuntu Pack- age	Needed for	
Core Dependen	cies		
CFFI	python3-cffi	Bars and popups	
cairocffi	python3- cairocffi	Drawing on bars and popups (if using X11 install xcffib BEFORE installing cairocffi, see below)	
libpangocairo	libpangocairo- 1.0-0	Writing on bars and popups	
dbus-next		Sending notifications with dbus (optional).	
X11			
X server	xserver-xorg	X11 backends	
xcffib	python3-xcffib	required for X11 backend	
Wayland			
wlroots	libwlroots-dev	Wayland backend (see below)	
pywlroots		python bindings for the wlroots library	
pywayland		python bindings for the wayland library	
python- xkbcommon		required for wayland backeds	

### 1.2.3 cairocffi

Qtile uses cairocffi for drawing on status bars and popup windows. Under X11, cairocffi requires XCB support via xcffib, which you should be sure to have installed **before** installing cairocffi; otherwise, the needed cairo-xcb bindings will not be built. Once you've got the dependencies installed, you can use the latest version on PyPI:

```
pip install --no-cache-dir cairocffi
```

### 1.2.4 Qtile

With the dependencies in place, you can now install the stable version of qtile from PyPI:

```
pip install qtile
```

Or install qtile-git with:

```
git clone https://github.com/qtile/qtile.git
cd qtile
pip install .
```

As long as the necessary libraries are in place, this can be done at any point, however, it is recommended that you first install xcffib to ensure the cairo-xcb bindings are built (X11 only) (see above).

# **1.3 Starting Qtile**

There are several ways to start Qtile. The most common way is via an entry in your X session manager's menu. The default Qtile behavior can be invoked by creating a qtile.desktop file in /usr/share/xsessions.

A second way to start Qtile is a custom X session. This way allows you to invoke Qtile with custom arguments, and also allows you to do any setup you want (e.g. special keyboard bindings like mapping caps lock to control, setting your desktop background, etc.) before Qtile starts. If you're using an X session manager, you still may need to create a custom.desktop file similar to the qtile.desktop file above, but with Exec=/etc/X11/xsession. Then, create your own ~/.xsession. There are several examples of user defined xsession s in the qtile-examples repository.

If there is no display manager such as SDDM, LightDM or other and there is need to start Qtile directly from ~/. xinitrc do that by adding exec qtile start at the end.

In very special cases, ex. Qtile crashing during session, then suggestion would be to start through a loop to save running applications:

```
while true; do
        qtile
done
```

Finally, if you're a gnome user, you can start integrate Qtile into Gnome's session manager and use gnome as usual.

### 1.3.1 Running from systemd

This case will cover automatic login to Qtile after booting the system without using display manager. It logins in virtual console and init X by running through session.

#### Automatic login to virtual console

To get login into virtual console as an example edit *getty* service by running *systemctl edit getty*@*tty1* and add instructions to */etc/system/getty@tty1.service.d/override.conf*:

```
[Service]
ExecStart=
ExecStart=-/usr/bin/agetty --autologin username --noclear %I $TERM
```

username should be changed to current user name.

Check more for other examples.

#### **Autostart X session**

After login X session should be started. That can be done by *.bash\_profile* if bash is used or *.zprofile* in case of zsh. Other shells can be adjusted by given examples.

```
if systemctl -q is-active graphical.target && [[ ! $DISPLAY && $XDG_VTNR -eq 1 ]]; then
    exec startx
fi
```

And to start Qtile itself .xinitrc should be fixed:

```
# some apps that should be started before Qtile, ex.
#
#
    [[ -f ~/.Xresources ]] && xrdb -merge ~/.Xresources
#
   ~/.fehbg &
#
  nm-applet &
#
  blueman-applet &
#
   dunst &
#
# or
#
#
   source ~/.xsession
exec qtile start
```

#### 1.3.2 Running Inside Gnome

Add the following snippet to your Qtile configuration. As per this page, it registers Qtile with gnome-session. Without it, a "Something has gone wrong!" message shows up a short while after logging in. dbus-send must be on your \$PATH.

```
import subprocess
import os
from libgtile import hook
@hook.subscribe.startup
def dbus_register():
    id = os.environ.get('DESKTOP_AUTOSTART_ID')
    if not id:
        return
    subprocess.Popen(['dbus-send',
                       '--session',
                       '--print-reply',
                       '--dest=org.gnome.SessionManager',
                       '/org/gnome/SessionManager',
                       'org.gnome.SessionManager.RegisterClient',
                       'string:qtile',
                       'string:' + id])
```

This adds a new entry "Qtile GNOME" to GDM's login screen.

```
$ cat /usr/share/xsessions/qtile_gnome.desktop
[Desktop Entry]
Name=Qtile GNOME
Comment=Tiling window manager
TryExec=/usr/bin/gnome-session
Exec=gnome-session --session=qtile
Type=XSession
```

The custom session for gnome-session.

For Gnome >= 3.23.2 (Ubuntu >= 17.04, Fedora >= 26, etc.)

Or for older Gnome versions

\$ cat /usr/share/gnome-session/sessions/qtile.session
[GNOME Session]
Name=Qtile session
RequiredComponents=qtile;gnome-settings-daemon;

So that Qtile starts automatically on login.

```
$ cat /usr/share/applications/qtile.desktop
[Desktop Entry]
Type=Application
Encoding=UTF-8
Name=Qtile
Exec=qtile start
NoDisplay=true
X-GNOME-WMName=Qtile
X-GNOME-Autostart-Phase=WindowManager
X-GNOME-Provides=windowmanager
X-GNOME-Autostart-Notify=false
```

The above does not start gnome-panel. Getting gnome-panel to work requires some extra Qtile configuration, mainly making the top and bottom panels static on panel startup and leaving a gap at the top (and bottom) for the panel window.

You might want to add keybindings to log out of the GNOME session.

```
Key([mod, 'control'], 'l', lazy.spawn('gnome-screensaver-command -l')),
Key([mod, 'control'], 'q', lazy.spawn('gnome-session-quit --logout --no-prompt')),
Key([mod, 'shift', 'control'], 'q', lazy.spawn('gnome-session-quit --power-off')),
```

The above apps need to be in your path (though they are typically installed in /usr/bin, so they probably are if they're installed at all).

# 1.4 Wayland

Qtile can be run as a Wayland compositor rather than an X11 window manager. For this, Qtile uses wlroots, a compositor library which is undergoing fast development. Be aware that some distributions package outdated versions of wlroots. More up-to-date distributions such as Arch Linux may package pywayland, pywlroots and python-xkbcommon. Also note that we may not have yet caught up with the latest wlroots release ourselves.

```
Note: We currently support wlroots==0.16.0,<0.17.0 and pywlroots==0.16.4.
```

With the Wayland dependencies in place, Qtile can be run either from a TTY, or within an existing X11 or Wayland session where it will run inside a nested window:

```
qtile start -b wayland
```

See the Wayland page for more information on running Qtile as a Wayland compositor.

Similar to the xsession example above, a wayland session file can be used to start qtile from a login manager. To use this, you should create a qtile-wayland.desktop file in /usr/share/wayland-sessions.

#### CHAPTER

## **RUNNING QTILE AS A WAYLAND COMPOSITOR**

Some functionality may not yet be implemented in the Wayland compositor. Please see the discussion here to see the current state of development. See here for unresolved Wayland-specific issues and see *troubleshooting* for tips on how to debug Wayland problems.

Note: We currently support wlroots>=0.16.0,<0.17.0 and pywlroots==0.16.4.

### 2.1 Backend-Specific Configuration

If you want your config file to work with different backends but want some options set differently per backend, you can check the name of the current backend in your config as follows:

```
from libqtile import qtile
if qtile.core.name == "x11":
    term = "urxvt"
elif qtile.core.name == "wayland":
    term = "foot"
```

# 2.2 Running X11-Only Programs

Qtile supports XWayland but requires that *wlroots* and *pywlroots* were built with XWayland support, and that XWayland is installed on the system from startup. XWayland will be started the first time it is needed.

#### 2.2.1 XWayland windows sometimes don't receive mouse events

There is currently a known bug (https://github.com/qtile/qtile/issues/3675) which causes pointer events (hover/click/scroll) to propagate to the wrong window when switching focus.

# 2.3 Input Device Configuration

### 2.3.1 InputConfig

#### class libqtile.backend.wayland.InputConfig(\*\*config: Any)

This is used to configure input devices. An instance of this class represents one set of settings that can be applied to an input device.

To use this, define a dictionary called wl\_input\_rules in your config. The keys are used to match input devices, and the values are instances of this class with the desired settings. For example:

```
from libqtile.backend.wayland import InputConfig
wl_input_rules = {
    "1267:12377:ELAN1300:00 04F3:3059 Touchpad": InputConfig(left_handed=True),
    "*": InputConfig(left_handed=True, pointer_accel=True),
    "type:keyboard": InputConfig(kb_options="ctrl:nocaps,compose:ralt"),
}
```

When a input device is being configured, the most specific matching key in the dictionary is found and the corresponding settings are used to configure the device. Unique identifiers are chosen first, then "type:X", then "\*".

The command qtile cmd-obj -o core -f get\_inputs can be used to get information about connected devices, including their identifiers.

Options default to None, leave a device's default settings intact. For information on what each option does, see the documenation for libinput: https://wayland.freedesktop.org/libinput/doc/latest/configuration.html. Note that devices often only support a subset of settings.

This tries to mirror how Sway configures libinput devices. For more information check out sway-input(5): https://man.archlinux.org/man/sway-input.5#LIBINPUT\_CONFIGURATION

Keyboards, managed by xkbcommon, are configured with the options prefixed by kb\_. X11's helpful XKB guide may be useful for figuring out the syntax for some of these settings.

#### **Configuration options**

key	default	description
accel_profile	None	'adaptive'or 'flat'
click_method	None	<pre>'none', 'button_areas' or 'clickfinger'</pre>
drag	None	True or False
drag_lock	None	True or False
dwt	None	True or False
kb_layout	None	Keyboard layout i.e. XKB_DEFAULT_LAYOUT
kb_options	None	Keyboard options i.e. XKB_DEFAULT_OPTIONS
kb_repeat_delay	600	Keyboard delay in milliseconds before repeating
kb_repeat_rate	25	Keyboard key repeats made per second
kb_variant	None	Keyboard variant i.e. XKB_DEFAULT_VARIANT
left_handed	None	True or False
middle_emulation	None	True or False
<pre>natural_scroll</pre>	None	True or False
pointer_accel	None	A float between -1 and 1.
scroll_button	None	'disable', 'Button[1-3,8,9]' or a keycode
<pre>scroll_method</pre>	None	<pre>'none', 'two_finger', 'edge', or 'on_button_down'</pre>
tap	None	True or False
tap_button_map	None	'lrm' or 'lmr'

If you want to change keyboard configuration during runtime, you can use the core's *set\_keymap* command (see below).

# 2.4 Core Commands

See the Wayland backend section in the API Commands documentation.

# TROUBLESHOOTING

## 3.1 So something has gone wrong... what do you do?

When Qtile is running, it logs error messages (and other messages) to its log file. This is found at ~/.local/share/ qtile/qtile.log. This is the first place to check to see what is going on. If you are getting unexpected errors from normal usage or your configuration (and you're not doing something wacky) and believe you have found a bug, then please *report a bug*.

If you are *hacking on Qtile* and you want to debug your changes, this log is your best friend. You can send messages to the log from within libquile by using the **logger**:

```
from libqtile.log_utils import logger
logger.warning("Your message here")
logger.warning(variable_you_want_to_print)
try:
    # some changes here that might error
except Exception:
    logger.exception("Uh oh!")
```

logger.warning is convenient because its messages will always be visibile in the log. logger.exception is helpful because it will print the full traceback of an error to the log. By sticking these amongst your changes you can look more closely at the effects of any changes you made to Qtile's internals.

# 3.2 X11: Capturing an xtrace

Occasionally, a bug will be low level enough to require an xtrace of Qtile's conversations with the X server. To capture one of these, create an xinitrc or similar file with:

exec xtrace qtile >> ~/qtile.log

This will put the xtrace output in Qtile's logfile as well. You can then demonstrate the bug, and paste the contents of this file into the bug report.

Note that xtrace may be named x11trace on some platforms, for example, on Fedora.

# 3.3 Debugging in Wayland

To get incredibly verbose output of communications between clients and the server, you can set WAYLAND\_DEBUG=1 in the environment before starting the process. This applies to the server itself, so be aware that running qtile with this set will generate lots of output for Qtile **and** all clients that it launches. If you're including this output with a bug report please try to cut out just the relevant portions.

If you're hacking on Qtile and would like this debug log output for it rather than any clients, it can be helpful to run the helper script at scripts/wephyr in the source from an existing session. You can then run clients from another terminal using the WAYLAND\_DISPLAY value printed by Qtile, so that the debug logs printed by Qtile are only the server's.

If you suspect a client may be responsible for a bug, it can be helpful to look at the issue trackers for other compositors, such as sway. Similarly if you're hacking on Qtile's internals and think you've found an unexpected quirk it may be helpful to search the issue tracker for whoots.

### CHAPTER

# **ENTRY POINTS**

Qtile uses a subcommand structure; various subcommands are listed below. Additionally, two other commands available in the scripts/ section of the repository are also documented below.

# 4.1 qtile start

This is the entry point for the window manager, and what you should run from your .xsession or similar. This will make an attempt to detect if quile is already running and fail if it is. See quile start --help for more details.

# 4.2 qtile shell

The Qtile command shell is a command-line shell interface that provides access to the full complement of Qtile command functions. The shell features command name completion, and full command documentation can be accessed from the shell itself. The shell uses GNU Readline when it's available, so the interface can be configured to, for example, obey VI keybindings with an appropriate .inputrc file. See the GNU Readline documentation for more information.

### 4.2.1 Navigating the Object Graph

The shell presents a filesystem-like interface to the command graph - the builtin "cd" and "ls" commands act like their familiar shell counterparts:

```
> ls
layout/ widget/ screen/ bar/ window/ group/
> cd screen
layout/ window/ bar/ widget/
> cd ..
/
> ls
layout/ widget/ screen/ bar/ window/ group/
```

If you try to access an object that has no "default" value then you will see an error message:

> ls
layout/ widget/ screen/ bar/ window/ group/

(continues on next page)

(continued from previous page)

```
> cd bar
Item required for bar
> ls bar
bar[bottom]/
> cd bar/bottom
bar['bottom']> ls
screen/ widget/
```

Please refer to *Navigating the command graph* for a summary of which objects need a specified selector and the type of selector required. Using 1s will show which selectors are available for an object. Please see below for an explanation about how Qtile displays shell paths.

Alternatively, the items() command can be run on the parent object to show which selectors are available. The first value shows whether a selector is optional (False means that a selector is required) and the second value is a list of selectors:

```
> ls
layout/ widget/ screen/ bar/ window/ group/
> items(bar)
(False, ['bottom'])
```

### 4.2.2 Displaying the shell path

Note that the shell provides a "short-hand" for specifying node keys (as opposed to children). The following is a valid shell path:

```
> cd group/4/window/31457314
```

The command prompt will, however, always display the Python node path that should be used in scripts and key bindings:

```
group['4'].window[31457314]>
```

### 4.2.3 Live Documentation

The shell help command provides the canonical documentation for the Qtile API:

(continues on next page)

(continued from previous page)

add	commands	current	delete	doc		
down	get_info	items	next	previous		
rotate	<pre>shuffle_down</pre>	<pre>shuffle_up</pre>	toggle_split	up		
layout[1]> 1	<pre>layout[1]&gt; help previous</pre>					
<pre>previous()</pre>						
Focus previ	Focus previous stack.					

# 4.3 qtile cmd-obj

This is a simple tool to expose quile.command functionality to shell. This can be used standalone or in other shell scripts.

### 4.3.1 How it works

qtile cmd-obj works by selecting a command object and calling a specified function of that object.

As per *Architecture*, Qtile's command graph has seven nodes: layout, window, group, bar, widget, screen, and a special root node. These are the objects that can be accessed via qtile cmd-obj (NB the root node is called cmd when using the cmd-obj script to give it an addressable name).

Running the command against a selected object without a function (-f) will run the help command and list the commands available to the object. Commands shown with an asterisk ("\*") require arguments to be passed via the -a flag.

#### Selecting an object

With the exception of cmd, all objects need an identifier so the correct object can be selected. Refer to *Navigating the command graph* for more information.

**Note:** You will see from the graph on *Architecture* that certain objects can be accessed from other objects. For example, qtile cmd-obj -o group term layout will list the commands for the current layout on the term group.

#### Information on functions

Running a function with the -i flag will provide additional detail about that function (i.e. what it does and what arguments it expects).

#### Passing arguments to functions

Arguments can be passed to a function by using the -a flag. For example, to change the label for the group named "1" to "A", you would run qtile cmd-obj -o group 1 -f set\_label -a A.

**Warning:** It is not currently possible to pass non-string arguments to functions via qtile cmd-obj. Doing so will result in an error.

### 4.3.2 Examples:

#### Output of qtile cmd-obj -h

```
usage: qtile cmd-obj [-h] [--object OBJ_SPEC [OBJ_SPEC ...]]
                 [--function FUNCTION] [--args ARGS [ARGS ...]] [--info]
Simple tool to expose qtile.command functionality to shell.
optional arguments:
 -h, --help
                        show this help message and exit
  --object OBJ_SPEC [OBJ_SPEC ...], -o OBJ_SPEC [OBJ_SPEC ...]
                        Specify path to object (space separated). If no
                        --function flag display available commands.
  --function FUNCTION, -f FUNCTION
                        Select function to execute.
  --args ARGS [ARGS ...], -a ARGS [ARGS ...]
                        Set arguments supplied to function.
  --info, -i
                        With both --object and --function args prints
                        documentation for function.
Examples:
qtile cmd-obj
qtile cmd-obj -o cmd
qtile cmd-obj -o cmd -f prev_layout -i
qtile cmd-obj -o cmd -f prev_layout -a 3 # prev_layout on group 3
qtile cmd-obj -o group 3 -f focus_back
qtile cmd-obj -o widget textbox -f update -a "New text"
qtile cmd-obj -o cmd -f restart # restart qtile
```

#### Output of qtile cmd-obj -o group 3

-o group 3 -f commands	Returns a list of possible commands for this object
-o group 3 -f doc	* Returns the documentation for a specified command name
-o group 3 -f eval	* Evaluates code in the same context as this function
-o group 3 -f focus_back	Focus the window that had focus before the current one
⇔got it.	
-o group 3 -f focus_by_name	$\ast$ Focus the first window with the given name. Do nothing_
$\rightarrow$ if the name is	
-o group 3 -f function	* Call a function with current object as argument
-o group 3 -f info	Returns a dictionary of info for this group
L	

(continues on next page)

(continued from previous page)

$\ast$ Get the info for the first window with the given <code>name_</code>
st Returns a list of contained items for the specified.
Focus the next window in group.
Focus the previous window in group.
$st$ Set the display name of current group to be used in_
* Switch position of current group with name
* Pull a group to a specified screen.
Unminimise all windows in this group

Output of qtile cmd-obj -o cmd

-o cmd -f add_rule	* Add a dgroup rule, returns rule_id needed to remove it
-o cmd -f addgroup	* Add a group with the given name
-o cmd -f commands	Returns a list of possible commands for this object
-o cmd -f critical	Set log level to CRITICAL
-o cmd -f debug	Set log level to DEBUG
-o cmd -f delgroup	* Delete a group with the given name
-o cmd -f display_kb	* Display table of key bindings
-o cmd -f doc	* Returns the documentation for a specified command name
-o cmd -f error	Set log level to ERROR
-o cmd -f eval	* Evaluates code in the same context as this function
-o cmd -f findwindow	* Launch prompt widget to find a window of the given name
<pre>-o cmd -f focus_by_click</pre>	* Bring a window to the front
-o cmd -f function	* Call a function with current object as argument
-o cmd -f get_info	Prints info for all groups
-o cmd -f get_state	Get pickled state for restarting qtile
-o cmd -f get_test_data	Returns any content arbitrarily set in the self.test_
⊶data attribute.	
-o cmd -f groups	Return a dictionary containing information for all
→groups	
-o cmd -f hide_show_bar	* Toggle visibility of a given bar
-o cmd -f info	Set log level to INFO
<pre>-o cmd -f internal_windows</pre>	Return info for each internal window (bars, for
→example)	
-o cmd -f items	$\ast$ Returns a list of contained items for the specified.
⇔name	
<pre>-o cmd -f list_widgets</pre>	List of all addressible widget names
<pre>-o cmd -f next_layout</pre>	* Switch to the next layout.
-o cmd -f next_screen	Move to next screen
<pre>-o cmd -f next_urgent</pre>	Focus next window with urgent hint
-o cmd -f pause	Drops into pdb
-o cmd -f prev_layout	* Switch to the previous layout.
-o cmd -f prev_screen	Move to the previous screen
-o cmd -f qtile_info	Returns a dictionary of info on the Qtile instance
-o cmd -f qtilecmd	* Execute a Qtile command using the client syntax
-o cmd -f remove_rule	* Remove a dgroup rule by rule_id
	(continues on next page)

(continues on next page)

(continued from previous page)

-o cmd -f restart	Restart qtile
<pre>-o cmd -f run_extension</pre>	* Run extensions
-o cmd -f run_external	* Run external Python script
-o cmd -f screens	Return a list of dictionaries providing information on $\Box$
→all screens	
-o cmd -f shutdown	Quit Qtile
<pre>-o cmd -f simulate_keypress</pre>	* Simulates a keypress on the focused window.
-o cmd -f spawn	* Run cmd in a shell.
-o cmd -f spawncmd	* Spawn a command using a prompt widget, with tab-
$\leftrightarrow$ completion.	
-o cmd -f status	Return "OK" if Qtile is running
<pre>-o cmd -f switch_groups</pre>	* Switch position of groupa to groupb
-o cmd -f switchgroup	$\ast$ Launch prompt widget to switch to a given group to the $\Box$
⇔current screen	
-o cmd -f sync	Sync the X display. Should only be used for development
<pre>-o cmd -f to_layout_index</pre>	* Switch to the layout with the given index in self.
⇔layouts.	
-o cmd -f to_screen	$\ast$ Warp focus to screen n, where n is a O-based screen.
→number	
-o cmd -f togroup	* Launch prompt widget to move current window to a given
⇔group	
<pre>-o cmd -f tracemalloc_dump</pre>	Dump tracemalloc snapshot
<pre>-o cmd -f tracemalloc_toggle</pre>	Toggle tracemalloc status
-o cmd -f warning	Set log level to WARNING
-o cmd -f windows	Return info for each client window

# 4.4 qtile run-cmd

Run a command applying rules to the new windows, ie, you can start a window in a specific group, make it floating, intrusive, etc.

The Windows must have NET\_WM\_PID.

```
# run xterm floating on group "test-group"
qtile run-cmd -g test-group -f xterm
```

# 4.5 qtile top

qtile top is a top-like tool to measure memory usage of Qtile's internals.

**Note:** To use qtile shell you need to have tracemalloc enabled. You can do this by setting the environmental variable PYTHONTRACEMALLOC=1 before starting qtile. Alternatively, you can force start tracemalloc but you will lose early traces:

```
>>> from libqtile.command.client import InteractiveCommandClient
>>> i=InteractiveCommandClient()
>>> i.eval("import tracemalloc;tracemalloc.start()")
```

# 4.6 dqtile-cmd

A Rofi/dmenu interface to qtile-cmd. Accepts all arguments of qtile-cmd.

### 4.6.1 Examples:

#### Output of dqtile-cmd -o cmd

dmenu:			
Alt-1  C-u Esc	Go back to menu. Clear input	W	function help (if -f is present)
-o cmd	-f add_rule	*	Add a dgroup rule, returns rule_id needed to remove it
-o cmd	-f addgroup	*	Add a group with the given name
-o cmd	-f commands		Returns a list of possible commands for this object
-o cmd	-f critical		Set log level to CRITICAL
-o cmd	-f debug		Set log level to DEBUG
-o cmd	-f delgroup	*	Delete a group with the given name
-o cmd	-f display_kb	*	Display table of key bindings
-o cmd	-f doc	*	Returns the documentation for a specified command name
-o cmd	-f error		Set log level to ERROR
-o cmd	-f eval	*	Evaluates code in the same context as this function
-o cmd	-f findwindow	*	Launch prompt widget to find a window of the given name
-o cmd	-f focus_by_click	*	Bring a window to the front
-o cmd	-f function	*	Call a function with current object as argument
-o cmd	-f get_info		Prints info for all groups
-o cmd	-f get_state		Get pickled state for restarting qtile

#### Output of dqtile-cmd -h

```
dqtile-cmd
   A Rofi/dmenu interface to qtile-cmd. Excepts all arguments of qtile-cmd
    (see below).
usage: dqtile-cmd [-h] [--object OBJ_SPEC [OBJ_SPEC ...]]
                  [--function FUNCTION] [--args ARGS [ARGS ...]] [--info]
Simple tool to expose qtile.command functionality to shell.
optional arguments:
  -h, --help
                        show this help message and exit
  --object OBJ_SPEC [OBJ_SPEC ...], -o OBJ_SPEC [OBJ_SPEC ...]
                        Specify path to object (space separated). If no
                        --function flag display available commands.
  --function FUNCTION, -f FUNCTION
                        Select function to execute.
  --args ARGS [ARGS ...], -a ARGS [ARGS ...]
                        Set arguments supplied to function.
                        With both --object and --function args prints
  --info, -i
```

(continues on next page)

(continued from previous page)

```
documentation for function.

Examples:

dqtile-cmd

dqtile-cmd -o cmd

dqtile-cmd -o cmd -f prev_layout -i

dqtile-cmd -o cmd -f prev_layout -a 3 # prev_layout on group 3

dqtile-cmd -o group 3 -f focus_back

If both rofi and dmenu are present rofi will be selected as default, to change this us --

→force-dmenu as the first argument.
```

# 4.7 iqshell

In addition to the standard qtile shell shell interface, we provide a kernel capable of running through Jupyter that hooks into the qshell client. The command structure and syntax is the same as qshell, so it is recommended you read that for more information about that.

### 4.7.1 Dependencies

In order to run iqshell, you must have ipykernel and jupyter\_console. You can install the dependencies when you are installing qtile by running:

\$ pip install qtile[ipython]

Otherwise, you can just install these two packages separately, either through PyPI or through your distribution package manager.

### 4.7.2 Installing and Running the Kernel

Once you have the required dependencies, you can run the kernel right away by running:

\$ python3 -m libqtile.interactive.iqshell\_kernel

However, this will merely spawn a kernel instance, you will have to run a separate frontend that connects to this kernel.

A more convenient way to run the kernel is by registering the kernel with Jupyter. To register the kernel itself, run:

\$ python3 -m libqtile.interactive.iqshell\_install

If you run this as a non-root user, or pass the --user flag, this will install to the user Jupyter kernel directory. You can now invoke the kernel directly when starting a Jupyter frontend, for example:

\$ jupyter console --kernel qshell

The iqshell script will launch a Jupyter terminal console with the qshell kernel.

### 4.7.3 iqshell vs qtile shell

One of the main drawbacks of running through a Jupyter kernel is the frontend has no way to query the current node of the kernel, and as such, there is no way to set a custom prompt. In order to query your current node, you can call pwd.

This, however, enables many of the benefits of running in a Jupyter frontend, including being able to save, run, and re-run code cells in frontends such as the Jupyter notebook.

The Jupyter kernel also enables more advanced help, text completion, and introspection capabilities (however, these are currently not implemented at a level much beyond what is available in the standard qtile shell).

### CHAPTER

# ARCHITECTURE

This page explains how Qtile's API works and how it can be accessed. Users who just want to find a list of commands can jump to *the API commands page*.

Qtile's command API is based on a graph of objects, where each object has a set of associated commands, combined with a number of interfaces that are used to navigate the graph and execute associated commands.

This page gives an overview of the command graph and the various interfaces accessible by users. The documentation also contains details of all the commands that are exposed by objects on the graph.

**Note:** While users are able to access the internal python objects (e.g. via a qtile instance), this is not part of the "official" API. These objects and method are not currently included in the documentation but can be viewed by looking at the source code on github. Changes to commonly-used internal objects will be kept to a minimum.

The graph and object commands are used in a number of different places:

- Commands can be *bound to keys* in the Qtile configuration file using the lazy interface.
- Commands can be called from a script using one of the various *available interfaces* to interact with Qtile from Python or shell scripts.

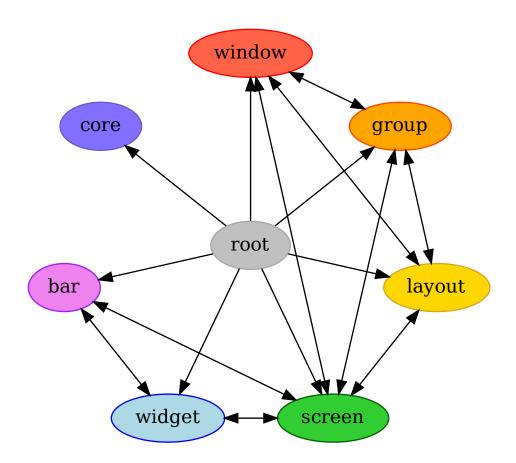

A couple of additional options are available if you are looking for more interactive access:

- Commands can be *called through qtile shell*, the Qtile shell.
- The shell can also be hooked into a Jupyter kernel called iqshell (NB this interface is currently broken).

If the explanations in the pages below seems a bit complex, please take a moment to explore the API using the qtile shell command shell. The shell provides a way to navigate the graph, allowing you to see how nodes are connected. Available nodes can be displayed with the ls command while command lists and detailed documentation can be accessed from the built-in help command. Commands can also be executed from this shell.

# 5.1 The Command Graph

The objects in Qtile's command graph come in eight flavours, matching the eight basic components of the window manager: layouts, windows, groups, bars, widgets, screens, core, and a special root node. Objects are addressed by a path specification that starts at the root and follows the available paths in the graph. This is what the graph looks like:

Each arrow can be read as "holds a reference to". So, we can see that a widget object *holds a reference to* objects of type bar, screen and group. Let's start with some simple examples of how the addressing works. Which particular objects we hold reference to depends on the context - for instance, widgets hold a reference to the screen that they appear on, and the bar they are attached to.

Let's look at an example, starting at the root node. The following script runs the status command on the root node, which, in this case, is represented by the InteractiveCommandClient object:

```
from libqtile.command.client import InteractiveCommandClient
c = InteractiveCommandClient()
print(c.status())
```

The InteractiveCommandClient is a class that allows us to traverse the command graph using attributes to select child nodes or commands. In this example, we have resolved the status() command on the root object. The interactive command client will automatically find and connect to a running Qtile instance, and which it will use to dispatch the call and print out the return.

An alternative is to use the CommandClient, which allows for a more precise resolution of command graph objects, but is not as easy to interact with from a REPL:

```
from libqtile.command.client import CommandClient
```

(continues on next page)

(continued from previous page)

```
c = CommandClient()
print(c.call("status")())
```

Like the interactive client, the command client will automatically connect to a running Qtile instance. Here, we first resolve the status() command with the .call("status"), which simply located the function, then we can invoke the call with no arguments.

For the rest of this example, we will use the interactive command client. From the graph, we can see that the root node holds a reference to group nodes. We can access the "info" command on the current group like so:

c.group.info()

To access a specific group, regardless of whether or not it is current, we use the Python mapping lookup syntax. This command sends group "b" to screen 1 (by the libqtile.config.Group.to\_screen() method):

c.group["b"].to\_screen(1)

In different contexts, it is possible to access a default object, where in other contexts a key is required. From the root of the graph, the current group, layout, screen and window can be accessed by simply leaving the key specifier out. The key specifier is mandatory for widget and bar nodes.

With this context, we can now drill down deeper in the graph, following the edges in the graphic above. To access the screen currently displaying group "b", we can do this:

c.group["b"].screen.info()

Be aware, however, that group "b" might not currently be displayed. In that case, it has no associated screen, the path resolves to a non-existent node, and we get an exception:

libqtile.command.CommandError: No object screen in path 'group['b'].screen'

The graph is not a tree, since it can contain cycles. This path (redundantly) specifies the group belonging to the screen that belongs to group "b":

c.group["b"].screen.group

This amount of connectivity makes it easy to reach out from a given object when callbacks and events fire on that object to related objects.

# 5.2 Navigating the command graph

As noted previously, some objects require a selector to ensure that the correct object is selected, while other nodes provide a default object without a selector.

The table below shows what selectors are required for the different nodes and whether the selector is optional (i.e. if it can be omitted to select the default object).

Object	Кеу	Optional?	Example
bar		No	
	"top", "bottom" (Note: if accessing this node from the root, users on multi-monitor setups may wish to navigate via a screen node to ensure that they select the correct object.)		c.screen.bar["bottom"]
group	Name string	Yes	c.group["one"] c.group
layout	Integer index	Yes	c.layout[2] c.layout
screen	Integer index	Yes	c.screen[1] c.screen
widget	Widget name (This is usually the name of the widget class in lower case but can be set by passing the name parameter to the widget.)	No	c.widget["textbox"]
window	Integer window ID	Yes	c.window[123456] c.window
core	No	n/a	c.core

# 5.3 Command graph development

This page provides further detail on how Qtile's command graph works. If you just want to script your Qtile window manager the *earlier information*, in addition to the documentation on the *available commands* should be enough to get started.

To develop the Qtile manager itself, we can dig into how Qtile represents these objects, which will lead to the way the commands are dispatched.

### 5.3.1 Client-Server Scripting Model

Qtile has a client-server control model - the main Qtile instance listens on a named pipe, over which marshalled command calls and response data is passed. This allows Qtile to be controlled fully from external scripts. Remote interaction occurs through an instance of the libqtile.command.interface.IPCCommandInterface class. This class establishes a connection to the currently running instance of Qtile. A libqtile.command.client. InteractiveCommandClient can use this connection to dispatch commands to the running instance. Commands then appear as methods with the appropriate signature on the InteractiveCommandClient object. The object hierarchy is described in the Architecture section of this manual. Full command documentation is available through the Qtile Shell.

### 5.3.2 Digging Deeper: Command Objects

All of the configured objects setup by Qtile are CommandObject subclasses. These objects are so named because we can issue commands against them using the command scripting API. Looking through the code, the commands that are exposed are commands that are decorated with the <code>@expose\_command()</code> decorator. When writing custom layouts, widgets, or any other object, you can add your own custom functions and, once you add the decorator, they will be callable using the standard command infrastructure. An available command can be extracted by calling .command() with the name of the command.

In addition to having a set of associated commands, each command object also has a collection of items associated with it. This is what forms the graph that is shown above. For a given object type, the items() method returns all of the names of the associated objects of that type and whether or not there is a defaultable value. For example, from the root, .items("group") returns the name of all of the groups and that there is a default value, the currently focused group.

To navigate from one command object to the next, the .select() method is used. This method resolves a requested object from the command graph by iteratively selecting objects. A selector like [("group", "b"), ("screen", None)] would be to first resolve group "b", then the screen associated to the group.

### 5.3.3 The Command Graph

In order to help in specifying command objects, there is the abstract command graph structure. The command graph structure allows us to address any valid command object and issue any command against it without needing to have any Qtile instance running or have anything to resolve the objects to. This is particularly useful when constructing lazy calls, where the Qtile instance does not exist to specify the path that will be resolved when the command is executed. The only limitation of traversing the command graph is that it must follow the allowed edges specified in the first section above.

Every object in the command graph is represented by a CommandGraphNode. Any call can be resolved from a given node. In addition, each node knows about all of the children objects that can be reached from it and have the ability to .navigate() to the other nodes in the command graph. Each of the object types are represented as CommandGraphObject types and the root node of the graph, the CommandGraphRoot represents the Qtile instance.

When a call is performed on an object, it returns a CommandGraphCall. Each call will know its own name as well as be able to resolve the path through the command graph to be able to find itself.

Note that the command graph itself can standalone, there is no other functionality within Qtile that it relies on. While we could have started here and built up, it is helpful to understand the objects that the graph is meant to represent, as the graph is just a representation of a traversal of the real objects in a running Qtile window manager. In order to tie the running Qtile instance to the abstract command graph, we move on to the command interface.

### 5.3.4 Executing graph commands: Command Interface

The CommandInterface is what lets us take an abstract call on the command graph and resolve it against a running command object. Put another way, this is what takes the graph traversal .group["b"].screen.info() and executes the info() command against the addressed screen object. Additional functionality can be used to check that a given traversal resolves to actual objects and that the requested command actually exists. Note that by construction of the command graph, the traversals here must be feasible, even if they cannot be resolved for a given configuration state. For example, it is possible to check the screen assoctiated to a group, even though the group may not be on a screen, but it is not possible to check the widget associated to a group.

The simplest form of the command interface is the QtileCommandInterface, which can take an in-process Qtile instance as the root CommandObject and execute requested commands. This is typically how we run the unit tests for Qtile.

The other primary example of this is the IPCCommandInterface which is able to then route all calls through an IPC client connected to a running Qtile instance. In this case, the command graph call can be constructed on the client side without having to dispatch to Qtile and once the call is constructed and deemed valid, the call can be executed.

In both of these cases, executing a command on a command interface will return the result of executing the command on a running Qtile instance. To support lazy execution, the LazyCommandInterface instead returns a LazyCall which is able to be resolved later by the running Qtile instance when it is configured to fire.

### 5.3.5 Tying it together: Command Client

So far, we have our running Command Objects and the Command Interface to dispatch commands against these objects as well as the Command Graph structure itself which encodes how to traverse the connections between the objects. The final component which ties everything together is the Command Client, which allows us to navigate through the graph to resolve objects, find their associated commands, and execute the commands against the held command interface.

The idea of the command client is that it is created with a reference into the command graph and a command interface. All navigation can be done against the command graph, and traversal is done by creating a new command client starting from the new node. When a command is executed against a node, that command is dispatched to the held command interface. The key decision here is how to perform the traversal. The command client exists in two different flavors: the standard CommandClient which is useful for handling more programatic traversal of the graph, calling methods to traverse the graph, and the InteractiveCommandClient which behaves more like a standard Python object, traversing by accessing properties and performing key lookups.

Returning to our examples above, we now have the full context to see what is going on when we call:

```
from libqtile.command.client import CommandClient
c = CommandClient()
print(c.call("status")())
from libqtile.command.client import InteractiveCommandClient
c = InteractiveCommandClient()
print(c.status())
```

In both cases, the command clients are constructed with the default command interface, which sets up an IPC connection to the running Qtile instance, and starts the client at the graph root. When we call c.call("status") or c.status, we navigate the command client to the status command on the root graph object. When these are invoked, the commands graph calls are dispatched via the IPC command interface and the results then sent back and printed on the local command line.

The power that can be realized by separating out the traversal and resolution of objects in the command graph from actually invoking or looking up any objects within the graph can be seen in the lazy module. By creating a lazy evaluated command client, we can expose the graph traversal and object resolution functionality via the same InteractiveCommandClient that is used to perform live command execution in the Qtile prompt.

# CHAPTER

SIX

# **INTERFACES**

# 6.1 Introduction

This page provides an overview of the various interfaces available to interact with Qtile's command graph.

- lazy calls
- when running qtile shell
- when running qtile cmd-obj
- when using CommandClient or InteractiveCommandClient in python

The way that these commands are called varies depending on which option you select. However, all interfaces follow the same, basic approach: navigate to the desired object and then execute a command on that object. The following examples illustrate this principle by showing how the same command can be accessed by the various interfaces:

```
Lazy call:
lazy.widget["volume"].increase_volume()
qtile shell:
> cd widget/volume
widget[volume] > increase_volume()
qtile cmd-obj:
qtile cmd-obj -o widget volume -f increase_volume
CommandClient:
>>> from libqtile.command.client import CommandClient
>>> c = CommandClient()
>>> c.navigate("widget", "volume").call("increase_volume")
InteractiveCommandClient:
>>> from libqtile.command.client import InteractiveCommandClient
>>> c = InteractiveCommandClient()
>>> c.widget["volume"].increase_volume()
```

# 6.2 The Interfaces

From the examples above, you can see that there are five main interfaces which can be used to interact with Qtile's command graph. Which one you choose will depend on how you intend to use it as each interface is suited to different scenarios.

- The lazy interface is used in config scripts to bind commands to keys and mouse callbacks.
- The qtile shell is a tool for exploring the graph my presenting it as a file structure. It is not designed to be used for scripting.
- For users creating shell scripts, the qtile cmd-obj interface would be the recommended choice.
- For users wanting to control Qtile from a python script, there are two available interfaces libqtile.command. client.CommandClient and libqtile.command.client.InteractiveCommandClient. Users are advised to use the InteractiveCommandClient as this simplifies the syntax for navigating the graph and calling commands.

# 6.2.1 The Lazy interface

The lazy.lazy object is a special helper object to specify a command for later execution. Lazy objects are typically users' first exposure to Qtile's command graph but they may not realise it. However, understanding this will help users when they try using some of the other interfaces listed on this page.

The basic syntax for a lazy command is:

```
lazy.node[selector].command(arguments)
```

No node is required when accessing commands on the root node. In addition, multiple nodes can be sequenced if required to navigate to a specific object. For example, bind a key that would focus the next window on the active group on screen 2, you would create a lazy object as follows:

```
lazy.screen[1].group.next_window()
```

**Note:** As noted above, lazy calls do not call the relevant command but only create a reference to it. While this makes it ideal for binding commands to key presses and mouse\_callbacks for widgets, it also means that lazy calls cannot be included in user-defined functions.

# 6.2.2 qtile shell

The qtile shell maps the command graph to a virtual filesystem that can be navigated in a similar way. While it is unlikely to be used for scripting, the qtile shell interface provides an excellent means for users to navigate and familiarise themselves with the command graph.

For more information, please refer to qtile shell

# 6.2.3 qtile cmd-obj

qtile cmd-obj is a command line interface for executing commands on the command graph. It can be used as a standalone command (e.g. executed directly from the terminal) or incorporated into shell scripts.

For more information, please refer to qtile cmd-obj

# 6.2.4 CommandClient

The CommandClient interface is a low-level python interface for accessing and navigating the command graph. The low-level nature means that navigation steps must be called explicitly, rather than being inferred from the body of the calling command.

For example:

```
from libqtile.command.client import CommandClient
c = CommandClient()
# Call info command on clock widget
info = c.navigate("widget", "clock").call("info")
# Call info command on the screen displaying the clock widget
info = c.navigate("widget", "clock").navigate("screen", None).call("info")
```

Note from the last example that each navigation step must be called separately. The arguments passed to navigate() are node and selector. selector is None when you wish to access the default object on that node (e.g. the current screen).

More technical explanation about the python command clients can be found at *Executing graph commands: Command Interface*.

# 6.2.5 InteractiveCommandClient

The InteractiveCommandClient is likely to be the more popular interface for users wishing to access the command graph via external python scripts. One of the key differences between the InteractiveCommandClient and the above CommandClient is that the InteractiveCommandClient removes the need to call navigate and call explicitly. Instead, the syntax mimics that of the lazy interface.

For example, to call the same commands in the above example:

```
from libqtile.command.client import InteractiveCommandClient
c = InteractiveCommandClient()
# Call info command on clock widget
info = c.widget["clock"].info()
# Call info command on the screen displaying the clock widget
info = c.widget["clock"].screen.info()
```

# CHAPTER

# SEVEN

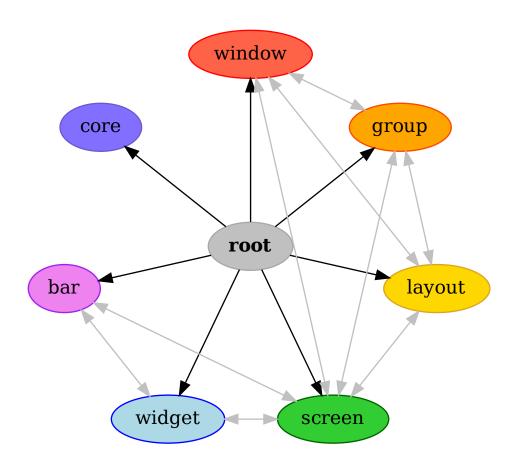

# **COMMANDS API**

The following pages list all the commands that are exposed by Qtile's command graph. As a result, all of these commands are accessible by any of the various interfaces provided by Qtile (e.g. the lazy interface for keybindings and mouse callbacks).

# 7.1 Qtile root object

The root node represents the main Qtile manager instance. Many of the commands on this node are therefore related to the running of the application itself.

The root can access every other node in the command graph. Certain objects can be accessed without a selector resulting in the current object being selected (e.g. current group, screen, layout, window).

# class libqtile.core.manager.Qtile

# **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy. <command/> ()
qtile cmd-obj -o cmd -f <command/>

The following commands are available for this object:

<pre>add_rule(match_args, rule_args[, min_priorty])</pre>	Add a dgroup rule, returns rule_id needed to remove it
<pre>addgroup(group[, label, layout, layouts, index])</pre>	Add a group with the given name
	continuos on povt paga

continues on next page

	a from previous page
<pre>change_window_order(new_location)</pre>	Change the order of the current window within the current group.
commands()	Returns a list of possible commands for this object
critical()	Set log level to CRITICAL
debug()	Set log level to DEBUG
delgroup(group)	Delete a group with the given name
display_kb()	Display table of key bindings
doc(name)	Returns the documentation for a specified command
	name
error()	Set log level to ERROR
eval(code)	Evaluates code in the same context as this function
<pre>findwindow([prompt, widget])</pre>	Launch prompt widget to find a window of the given name
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
get_groups()	Return a dictionary containing information for all
	groups
get_screens()	Return a list of dictionaries providing information on all screens
get_state()	Get pickled state for restarting qtile
get_test_data()	Returns any content arbitrarily set in the self.test_data attribute.
hide_show_bar([position])	Toggle visibility of a given bar
info()	Set log level to INFO
internal_windows()	Return info for each internal window (bars, for exam-
	ple)
items(name)	Build a list of contained items for the given item class.
<pre>labelgroup([prompt, widget])</pre>	Launch prompt widget to label the current group
list_widgets()	List of all addressible widget names
loglevel()	
<pre>loglevelname()</pre>	
<pre>next_layout([name])</pre>	Switch to the next layout.
<pre>next_screen()</pre>	Move to next screen
<pre>next_urgent()</pre>	Focus next window with urgent hint
pause()	Drops into pdb
<pre>prev_layout([name])</pre>	Switch to the previous layout.
prev_screen()	Move to the previous screen
<pre>qtile_info()</pre>	Returns a dictionary of info on the Qtile instance
<pre>qtilecmd([prompt, widget, messenger])</pre>	Execute a Qtile command using the client syntax
<pre>reconfigure_screens([ev])</pre>	This can be used to set up screens again during run time.
<pre>reload_config()</pre>	Reload the configuration file.
remove_rule(rule_id)	Remove a dgroup rule by rule_id
restart()	Restart Qtile.
run_extension(extension)	Run extensions
shutdown()	Quit Qtile
<pre>simulate_keypress(modifiers, key)</pre>	Simulates a keypress on the focused window.
spawn(cmd[, shell])	Spawn a new process.
spawncmd([prompt, widget, command,])	Spawn a command using a prompt widget, with tab- completion.
status()	Return "OK" if Qtile is running

Table 1 – continued from previous page

continues on next page

<pre>switch_groups(namea, nameb)</pre>	Switch position of two groups by name
<pre>switch_window(location)</pre>	Change to the window at the specified index in the current group.
<pre>switchgroup([prompt, widget])</pre>	Launch prompt widget to switch to a given group to the current screen
sync()	Sync the backend's event queue.
<pre>to_layout_index(index[, name])</pre>	Switch to the layout with the given index in self.layouts.
to_screen(n)	Warp focus to screen n, where n is a 0-based screen number
togroup([prompt, widget])	Launch prompt widget to move current window to a given group
<pre>tracemalloc_dump()</pre>	Dump tracemalloc snapshot
<pre>tracemalloc_toggle()</pre>	Toggle tracemalloc status
ungrab_all_chords()	Leave all chord modes and grab the root bindings
ungrab_chord()	Leave a chord mode
<pre>validate_config()</pre>	
warning()	Set log level to WARNING
windows()	Return info for each client window

#### Table 1 – continued from previous page

## **Command documentation**

add\_rule(match\_args: dict[str, Any], rule\_args: dict[str, Any], min\_priorty: bool = False)  $\rightarrow$  int | None Add a dgroup rule, returns rule\_id needed to remove it

#### **Parameters**

match\_args config.Match arguments

rule\_args config.Rule arguments

# min\_priorty

If the rule is added with minimum priority (last) (default: False)

addgroup(group: str, label: str | None = None, layout: str | None = None, layouts: list[Layout] | None = None, index: int | None = None)  $\rightarrow$  bool

Add a group with the given name

#### **change\_window\_order**(*new\_location: int*) → None

Change the order of the current window within the current group.

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

# $\texttt{critical()} \rightarrow \texttt{None}$

Set log level to CRITICAL

#### $debug() \rightarrow None$

Set log level to DEBUG

#### **delgroup**(group: str) $\rightarrow$ None

Delete a group with the given name

#### $display_kb() \rightarrow str$

Display table of key bindings

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

 $error() \rightarrow None$ 

Set log level to ERROR

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**findwindow**(*prompt:* str = 'window', widget: str = 'prompt')  $\rightarrow$  None

Launch prompt widget to find a window of the given name

#### **Parameters**

prompt

Text with which to prompt user (default: "window")

widget

Name of the prompt widget (default: "prompt")

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

```
get_groups() \rightarrow dict[str, dict[str, Any]]
```

Return a dictionary containing information for all groups

#### **Examples**

get\_groups()

 $get\_screens() \rightarrow list[dict[str, Any]]$ 

Return a list of dictionaries providing information on all screens

get\_state()  $\rightarrow$  str

Get pickled state for restarting qtile

 $\texttt{get\_test\_data()} \to \operatorname{Any}$ 

Returns any content arbitrarily set in the self.test\_data attribute. Useful in tests.

**hide\_show\_bar**(*position: Literal['top', 'bottom', 'left', 'right', 'all']* = 'all')  $\rightarrow$  None Toggle visibility of a given bar

**Parameters** 

#### position

one of: "top", "bottom", "left", "right", or "all" (default: "all")

#### $info() \rightarrow None$

Set log level to INFO

#### internal\_windows() → list[dict[str, Any]]

Return info for each internal window (bars, for example)

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

**labelgroup**(*prompt: str* = '*label*', *widget: str* = '*prompt*')  $\rightarrow$  None

Launch prompt widget to label the current group

#### **Parameters**

# prompt Text with which to prompt user (default: "label")

widget

Name of the prompt widget (default: "prompt")

# $\texttt{list\_widgets()} \rightarrow \textit{list[str]}$

List of all addressible widget names

# $\texttt{loglevel}(\texttt{)} \to \mathsf{int}$

#### $loglevelname() \rightarrow str$

**next\_layout**(*name: str* | *None* = *None*)  $\rightarrow$  None

Switch to the next layout.

# Parameters

name

Group name. If not specified, the current group is assumed

 $next\_screen() \rightarrow None$ 

Move to next screen

# $next\_urgent() \rightarrow None$

Focus next window with urgent hint

# $pause() \rightarrow None$

Drops into pdb

#### **prev\_layout** (*name: str* | *None* = *None*) $\rightarrow$ None

Switch to the previous layout.

## Parameters

#### name

Group name. If not specified, the current group is assumed

#### $prev_screen() \rightarrow None$

Move to the previous screen

#### **qtile\_info(**) → dict

Returns a dictionary of info on the Qtile instance

**qtilecmd**(prompt: str = 'command', widget: str = 'prompt', messenger: str = 'xmessage')  $\rightarrow$  None

Execute a Qtile command using the client syntax

Tab completion aids navigation of the command tree

#### Parameters

#### prompt

Text to display at the prompt (default: "command: ")

#### widget

Name of the prompt widget (default: "prompt")

#### messenger

Command to display output, set this to None to disable (default: "xmessage")

## **reconfigure\_screens**(*ev:* Any = None) $\rightarrow$ None

This can be used to set up screens again during run time. Intended usage is to be called when the screen\_change hook is fired, responding to changes in physical monitor setup by configuring qtile.screens accordingly. The ev kwarg is ignored; it is here in case this function is hooked directly to screen\_change.

#### $reload\_config() \rightarrow None$

Reload the configuration file.

Can also be triggered by sending Qtile a SIGUSR1 signal.

#### **remove\_rule**(*rule\_id: int*) $\rightarrow$ None

Remove a dgroup rule by rule\_id

#### $\texttt{restart()} \rightarrow \text{None}$

Restart Qtile.

Can also be triggered by sending Qtile a SIGUSR2 signal.

# $run_extension(extension: \_Extension) \rightarrow None$

Run extensions

#### $shutdown() \rightarrow None$

Quit Qtile

## $simulate_keypress(modifiers: list[str], key: str) \rightarrow None$

Simulates a keypress on the focused window.

This triggers internal bindings only; for full simulation see external tools such as xdotool or ydotool.

## Parameters

#### modifiers

A list of modifier specification strings. Modifiers can be one of "shift", "lock", "control" and "mod1" - "mod5".

## key

Key specification.

## **Examples**

simulate\_keypress(["control", "mod2"], "k")

**spawn**(*cmd: str* | *list*[*str*], *shell: bool* = *False*)  $\rightarrow$  int

Spawn a new process.

# Parameters

## cmd:

The command to execute either as a single string or list of strings.

# shell:

Whether to execute the command in a new shell by prepending it with "/bin/sh -c". This enables the use of shell syntax within the command (e.g. pipes).

#### **Examples**

spawn("firefox")

spawn(["xterm", "-T", "Temporary terminal"])

spawn("screenshot | xclip", shell=True)

**spawncmd**(*prompt:* str = 'spawn', widget: str = 'prompt', command: str = '%s', complete: str = 'cmd', shell: bool = True, aliases: dict[str, str] | None = None)  $\rightarrow$  None

Spawn a command using a prompt widget, with tab-completion.

#### Parameters

#### prompt

Text with which to prompt user (default: "spawn: ").

#### widget

Name of the prompt widget (default: "prompt").

# command

command template (default: "%s").

#### complete

Tab completion function (default: "cmd")

## shell

Execute the command with /bin/sh (default: True)

#### aliases

Dictionary mapping aliases to commands. If the entered command is a key in this dict, the command it maps to will be executed instead.

# $\texttt{status()} \rightarrow Literal['OK']$

Return "OK" if Qtile is running

#### $switch_groups(namea: str, nameb: str) \rightarrow None$

Switch position of two groups by name

#### $switch_window(location: int) \rightarrow None$

Change to the window at the specified index in the current group.

**switchgroup**(*prompt: str* = '*group*', *widget: str* = '*prompt*')  $\rightarrow$  None

Launch prompt widget to switch to a given group to the current screen

#### **Parameters**

prompt
Text with which to prompt user (default: "group")

1 1

widget

Name of the prompt widget (default: "prompt")

 $sync() \rightarrow None$ 

Sync the backend's event queue. Should only be used for development.

**to\_layout\_index**(*index: str, name: str* | *None* = *None*)  $\rightarrow$  None

Switch to the layout with the given index in self.layouts.

#### **Parameters**

#### index

Index of the layout in the list of layouts.

name

Group name. If not specified, the current group is assumed.

 $to\_screen(n: int) \rightarrow None$ 

Warp focus to screen n, where n is a 0-based screen number

#### **Examples**

to\_screen(0)

**togroup**(*prompt: str* = '*group*', *widget: str* = '*prompt*')  $\rightarrow$  None Launch prompt widget to move current window to a given group

#### **Parameters**

prompt

Text with which to prompt user (default: "group")

widget

Name of the prompt widget (default: "prompt")

 $\texttt{tracemalloc\_dump()} \rightarrow \texttt{tuple[bool, str]}$ 

Dump tracemalloc snapshot

 $\texttt{tracemalloc\_toggle()} \rightarrow \textit{None}$ 

Toggle tracemalloc status

Running tracemalloc is required for *qtile top* 

# $\textbf{ungrab\_all\_chords()} \rightarrow None$

Leave all chord modes and grab the root bindings

#### ungrab\_chord() $\rightarrow$ None

Leave a chord mode

# $\textbf{validate\_config()} \rightarrow None$

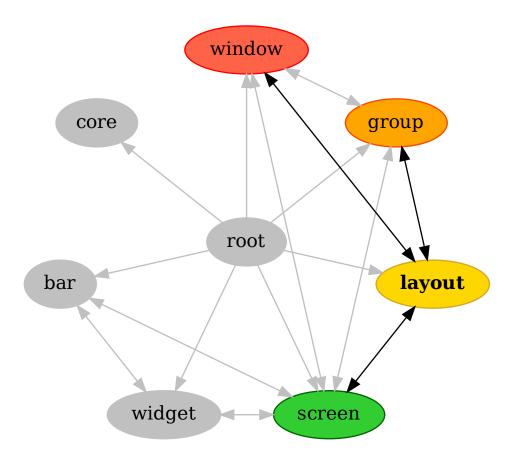

warning()  $\rightarrow$  None Set log level to WARNING

windows ()  $\rightarrow$  list[dict[str, Any]] Return info for each client window

# 7.2 Layout objects

Layouts position windows according to their specific rules. Layout commands typically include moving windows around the layout and changing the size of windows.

Layouts can access the windows being displayed, the group holding the layout and the screen displaying the layout.

# 7.2.1 Bsp

# class libqtile.layout.bsp.Bsp

# API commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

<pre>commands() doc(name)</pre>	Returns a list of possible commands for this object Returns the documentation for a specified command name
down()	
<pre>eval(code) flip_down()</pre>	Evaluates code in the same context as this function
flip_left()	
<pre>flip_right()</pre>	
flip_up()	
<pre>function(function, *args, **kwargs) grow_down()</pre>	Call a function with current object as argument
<pre>grow_left()</pre>	
grow_right()	
grow_up()	
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
left()	
next()	
normalize()	
previous()	
right()	
<pre>shuffle_down()</pre>	
<pre>shuffle_left()</pre>	
<pre>shuffle_right()</pre>	
<pre>shuffle_up()</pre>	
<pre>toggle_split()</pre>	
up()	

# **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

### down()

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

flip\_down()

flip\_left()

flip\_right()

flip\_up()

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

grow\_down()

grow\_left()

grow\_right()

# grow\_up()

```
info() \rightarrow dict[str, Any]
```

Returns a dictionary of layout information

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# left()

# **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

 $\texttt{doc}(\textit{name}) \rightarrow \textit{str}$ 

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

# down()

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

```
grow_down()
```

grow\_left()

grow\_right()

grow\_up()

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.2.3 Floating

# class libqtile.layout.floating.Floating

# **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
<i>items</i> (name)	Build a list of contained items for the given item class.
next()	
previous()	

### **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

```
info() \rightarrow dict[str, Any]
```

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

 $\texttt{next()} \rightarrow None$ 

 $previous() \rightarrow None$ 

# 7.2.4 Matrix

# class libqtile.layout.matrix.Matrix

# **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

add()	Increase number of columns
commands()	Returns a list of possible commands for this object
delete()	Decrease number of columns
<i>doc</i> (name)	Returns the documentation for a specified command
	name
down()	Switch to the next window in current column
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
<i>items</i> (name)	Build a list of contained items for the given item class.
left()	Switch to the next window on current row
next()	
previous()	
right()	Switch to the next window on current row
up()	Switch to the previous window in current column

# **Command documentation**

# add()

Increase number of columns

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

# delete()

Decrease number of columns

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

## down()

Switch to the next window in current column

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

# **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# left()

Switch to the next window on current row

```
next() \rightarrow None
```

# $\texttt{previous()} \rightarrow \text{None}$

#### right()

Switch to the next window on current row

#### up()

Switch to the previous window in current column

# 7.2.5 Max

# class libqtile.layout.max.Max

# **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
down()	
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
next()	
previous()	
up()	

# **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

# down()

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

# **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
next()
```

#### previous()

up()

# 7.2.6 MonadTall

# class libqtile.layout.xmonad.MonadTall

# **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
doc(name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
flip()	Flip the layout horizontally
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
grow()	Grow current window
grow_main()	Grow main pane
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
left()	Focus on the closest window to the left of the current window
<pre>maximize()</pre>	Grow the currently focused client to the max size
next()	2
<pre>normalize([redraw])</pre>	Evenly distribute screen-space among secondary clients
previous()	
<pre>reset([ratio, redraw])</pre>	Reset Layout.
right()	Focus on the closest window to the right of the current window
<pre>set_ratio(ratio)</pre>	Directly set the main pane ratio
<pre>shrink()</pre>	Shrink current window
<pre>shrink_main()</pre>	Shrink main pane
<pre>shuffle_down()</pre>	Shuffle the client down the stack
<pre>shuffle_up()</pre>	Shuffle the client up the stack
swap(window1, window2)	Swap two windows
<pre>swap_left()</pre>	Swap current window with closest window to the left
<pre>swap_main()</pre>	Swap current window to main pane
<pre>swap_right()</pre>	Swap current window with closest window to the right

# **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

```
doc(name) \rightarrow str
```

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

# flip()

Flip the layout horizontally

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### grow()

Grow current window

Will grow the currently focused client reducing the size of those around it. Growing will stop when no other secondary clients can reduce their size any further.

#### grow\_main()

Grow main pane

Will grow the main pane, reducing the size of clients in the secondary pane.

```
info() \rightarrow dict[str, Any]
```

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# left()

Focus on the closest window to the left of the current window

#### maximize()

Grow the currently focused client to the max size

```
next() \rightarrow None
```

```
normalize(redraw=True)
```

Evenly distribute screen-space among secondary clients

# $\texttt{previous()} \rightarrow \texttt{None}$

reset(ratio=None, redraw=True)

Reset Layout.

#### right()

Focus on the closest window to the right of the current window

## set\_ratio(ratio)

Directly set the main pane ratio

# shrink()

Shrink current window

Will shrink the currently focused client reducing the size of those around it. Shrinking will stop when the client has reached the minimum size.

#### shrink\_main()

Shrink main pane

Will shrink the main pane, increasing the size of clients in the secondary pane.

# shuffle\_down()

Shuffle the client down the stack

## shuffle\_up()

Shuffle the client up the stack

swap(window1: Window, window2: Window)  $\rightarrow$  None

Swap two windows

# swap\_left()

Swap current window with closest window to the left

# swap\_main()

Swap current window to main pane

## swap\_right()

Swap current window with closest window to the right

# 7.2.7 MonadThreeCol

# class libqtile.layout.xmonad.MonadThreeCol

# **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
flip()	Flip the layout horizontally
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
grow()	Grow current window
grow_main()	Grow main pane
items(name)	Build a list of contained items for the given item class.
left()	Focus on the closest window to the left of the current window
maximize()	Grow the currently focused client to the max size
next()	
<pre>normalize([redraw])</pre>	Evenly distribute screen-space among secondary clients
<pre>previous()</pre>	
<pre>reset([ratio, redraw])</pre>	Reset Layout.
right()	Focus on the closest window to the right of the current window
<pre>set_ratio(ratio)</pre>	Directly set the main pane ratio
<pre>shrink()</pre>	Shrink current window
<pre>shrink_main()</pre>	Shrink main pane
<pre>shuffle_down()</pre>	Shuffle the client down the stack
<pre>shuffle_up()</pre>	Shuffle the client up the stack
<pre>swap(window1, window2)</pre>	Swap two windows
<pre>swap_left()</pre>	Swap current window with closest window to the left
<pre>swap_main()</pre>	Swap current window to main pane
<pre>swap_right()</pre>	Swap current window with closest window to the right

# **Command documentation**

```
\textbf{commands()} \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

# flip()

Flip the layout horizontally

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### grow()

Grow current window

Will grow the currently focused client reducing the size of those around it. Growing will stop when no other secondary clients can reduce their size any further.

### grow\_main()

Grow main pane

Will grow the main pane, reducing the size of clients in the secondary pane.

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# left()

Focus on the closest window to the left of the current window

#### maximize()

Grow the currently focused client to the max size

#### **next()** $\rightarrow$ None

#### normalize(redraw=True)

Evenly distribute screen-space among secondary clients

# $\texttt{previous()} \rightarrow \texttt{None}$

#### reset(ratio=None, redraw=True)

Reset Layout.

#### right()

Focus on the closest window to the right of the current window

#### set\_ratio(ratio)

Directly set the main pane ratio

#### shrink()

Shrink current window

Will shrink the currently focused client reducing the size of those around it. Shrinking will stop when the client has reached the minimum size.

## shrink\_main()

Shrink main pane

Will shrink the main pane, increasing the size of clients in the secondary pane.

#### shuffle\_down()

Shuffle the client down the stack

## shuffle\_up()

Shuffle the client up the stack

swap(window1: Window, window2: Window)  $\rightarrow$  None Swap two windows

### swap\_left()

Swap current window with closest window to the left

# swap\_main()

Swap current window to main pane

# swap\_right()

Swap current window with closest window to the right

# 7.2.8 MonadWide

## class libqtile.layout.xmonad.MonadWide

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
doc(name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
flip()	Flip the layout horizontally
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
grow()	Grow current window
grow_main()	Grow main pane
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
left()	Focus on the closest window to the left of the current window
maximize()	Grow the currently focused client to the max size
next()	
<pre>normalize([redraw])</pre>	Evenly distribute screen-space among secondary
	clients
previous()	
<pre>reset([ratio, redraw])</pre>	Reset Layout.
right()	Focus on the closest window to the right of the current
	window
<pre>set_ratio(ratio)</pre>	Directly set the main pane ratio
<pre>shrink()</pre>	Shrink current window
<pre>shrink_main()</pre>	Shrink main pane
<pre>shuffle_down()</pre>	Shuffle the client down the stack
<pre>shuffle_up()</pre>	Shuffle the client up the stack
<pre>swap(window1, window2)</pre>	Swap two windows
<pre>swap_left()</pre>	Swap current window with closest window to the
	down
<pre>swap_main()</pre>	Swap current window to main pane
<pre>swap_right()</pre>	Swap current window with closest window to the up

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

# flip()

Flip the layout horizontally

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### grow()

Grow current window

Will grow the currently focused client reducing the size of those around it. Growing will stop when no other secondary clients can reduce their size any further.

#### grow\_main()

Grow main pane

Will grow the main pane, reducing the size of clients in the secondary pane.

```
info() \rightarrow dict[str, Any]
```

Returns a dictionary of layout information

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### left()

Focus on the closest window to the left of the current window

# maximize()

Grow the currently focused client to the max size

```
next() \rightarrow None
```

#### normalize(redraw=True)

Evenly distribute screen-space among secondary clients

# $\texttt{previous()} \rightarrow \text{None}$

#### reset(ratio=None, redraw=True)

Reset Layout.

## right()

Focus on the closest window to the right of the current window

#### set\_ratio(ratio)

Directly set the main pane ratio

## shrink()

Shrink current window

Will shrink the currently focused client reducing the size of those around it. Shrinking will stop when the client has reached the minimum size.

#### shrink\_main()

Shrink main pane

Will shrink the main pane, increasing the size of clients in the secondary pane.

# shuffle\_down()

Shuffle the client down the stack

# shuffle\_up()

Shuffle the client up the stack

swap(window1: Window, window2: Window)  $\rightarrow$  None

Swap two windows

# swap\_left()

Swap current window with closest window to the down

## swap\_main()

Swap current window to main pane

# swap\_right()

Swap current window with closest window to the up

# 7.2.9 RatioTile

# class libqtile.layout.ratiotile.RatioTile

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
decrease_ratio()	
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
<pre>increase_ratio()</pre>	
info()	Returns a dictionary of layout information
<pre>items(name)</pre>	Build a list of contained items for the given item class.
next()	
previous()	
<pre>shuffle_down()</pre>	
<pre>shuffle_up()</pre>	

## **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### decrease\_ratio()

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

```
eval(code: str) \rightarrow tuple[bool, str | None]
```

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### increase\_ratio()

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

 $next() \rightarrow None$ 

 $previous() \rightarrow None$ 

shuffle\_down()

shuffle\_up()

# 7.2.10 Slice

# class libqtile.layout.slice.Slice

# **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>move_to_slice()</pre>	Moves the current window to the slice.
next()	

previous()

## **Command documentation**

## commands()

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### **info()** $\rightarrow$ dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### move\_to\_slice()

Moves the current window to the slice.

**next()**  $\rightarrow$  None

 $previous() \rightarrow None$ 

# 7.2.11 Spiral

## class libqtile.layout.spiral.Spiral

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
decrease_ratio()	Decrease spiral ratio.
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
grow_main()	Grow the main window.
increase_ratio()	Increase spiral ratio.
<i>items</i> (name)	Build a list of contained items for the given item class.
next()	
previous()	
reset()	Reset ratios to values set in config.
<pre>set_master_ratio(ratio)</pre>	Set the ratio for the main window.
<pre>set_ratio(ratio)</pre>	Set the ratio for all windows.
<pre>shrink_main()</pre>	Shrink the main window.
<pre>shuffle_down()</pre>	
<pre>shuffle_up()</pre>	

#### **Command documentation**

#### **commands**() $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### decrease\_ratio()

Decrease spiral ratio.

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

## **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## grow\_main()

Grow the main window.

### increase\_ratio()

Increase spiral ratio.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

**next()**  $\rightarrow$  None

## $\texttt{previous()} \rightarrow \text{None}$

#### reset()

Reset ratios to values set in config.

#### set\_master\_ratio(ratio: float | str)

Set the ratio for the main window.

```
set_ratio(ratio: float | str)
```

Set the ratio for all windows.

## shrink\_main()

Shrink the main window.

## shuffle\_down()

shuffle\_up()

# 7.2.12 Stack

#### class libqtile.layout.stack.Stack

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

add()	Add another stack to the layout
<pre>client_to_next()</pre>	Send the current client to the next stack
<pre>client_to_previous()</pre>	Send the current client to the previous stack
<pre>client_to_stack(n)</pre>	Send the current client to stack n, where n is an integer offset.
commands()	Returns a list of possible commands for this object
delete()	Delete the current stack from the layout
<i>doc</i> (name)	Returns the documentation for a specified command name
down()	Switch to the next window in this stack
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
next()	Focus next stack
previous()	Focus previous stack
<pre>rotate()</pre>	Rotate order of the stacks
<pre>shuffle_down()</pre>	Shuffle the order of this stack down
<pre>shuffle_up()</pre>	Shuffle the order of this stack up
<pre>toggle_split()</pre>	Toggle vertical split on the current stack
up()	Switch to the previous window in this stack

#### add()

Add another stack to the layout

## client\_to\_next()

Send the current client to the next stack

## client\_to\_previous()

Send the current client to the previous stack

## client\_to\_stack(n)

Send the current client to stack n, where n is an integer offset. If is too large or less than 0, it is wrapped modulo the number of stacks.

## $\textbf{commands()} \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## delete()

Delete the current stack from the layout

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

## down()

Switch to the next window in this stack

## **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

function(function, \*args, \*\*kwargs)  $\rightarrow$  None

Call a function with current object as argument

 $info() \rightarrow dict[str, Any]$ 

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## **next()** $\rightarrow$ None

Focus next stack

 $\texttt{previous()} \rightarrow \texttt{None}$ 

Focus previous stack

## rotate()

Rotate order of the stacks

## shuffle\_down()

Shuffle the order of this stack down

## shuffle\_up()

Shuffle the order of this stack up

## toggle\_split()

Toggle vertical split on the current stack

up()

Switch to the previous window in this stack

# 7.2.13 Tile

## class libqtile.layout.tile.Tile

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

commands()	Returns a list of possible commands for this object
decrease_nmaster()	, , , , , , , , , , , , , , , , , , ,
decrease_ratio()	
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
<pre>increase_nmaster()</pre>	
<pre>increase_ratio()</pre>	
info()	Returns a dictionary of layout information
<i>items</i> (name)	Build a list of contained items for the given item class.
next()	
previous()	
reset()	
<pre>shuffle_down()</pre>	
<pre>shuffle_up()</pre>	

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

decrease\_nmaster()

#### decrease\_ratio()

```
doc(name) \rightarrow str
```

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

```
increase_nmaster()
```

```
increase_ratio()
```

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

 $\texttt{next()} \rightarrow \text{None}$ 

 $\texttt{previous}(\texttt{)} \to \texttt{None}$ 

reset()

shuffle\_down()

shuffle\_up()

# 7.2.14 TreeTab

## class libqtile.layout.tree.TreeTab

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

<pre>add_section(name)</pre>	Add named section to tree
collapse_branch()	
commands()	Returns a list of possible commands for this object
decrease_ratio()	
<pre>del_section(name)</pre>	Remove named section from tree
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
expand_branch()	
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
<pre>increase_ratio()</pre>	
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
<pre>move_down()</pre>	
<pre>move_left()</pre>	
<pre>move_right()</pre>	
<pre>move_up()</pre>	
nort()	Switch down in the window list
next() previous()	Switch down in the window list Switch up in the window list
section_down()	Switch up in the window list
<pre>section_up()</pre>	
<pre>sort_windows(sorter[, create_sections])</pre>	Sorts window to sections using sorter function

add\_section(name)

Add named section to tree

## collapse\_branch()

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## decrease\_ratio()

## del\_section(name)

Remove named section from tree

## $\texttt{doc}(\textit{name}) \rightarrow \textit{str}$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### expand\_branch()

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## increase\_ratio()

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
move_down()
```

move\_left()

move\_right()

move\_up()

 $next() \rightarrow None$ 

Switch down in the window list

#### $previous() \rightarrow None$

Switch up in the window list

#### section\_down()

section\_up()

#### sort\_windows(sorter, create\_sections=True)

Sorts window to sections using sorter function

#### Parameters

#### sorter: function with single arg returning string

returns name of the section where window should be

#### create\_sections:

if this parameter is True (default), if sorter returns unknown section name it will be created dynamically

# 7.2.15 VerticalTile

## class libqtile.layout.verticaltile.VerticalTile

### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
grow()	
info()	Returns a dictionary of layout information
items(name)	Build a list of contained items for the given item class.
<pre>maximize()</pre>	
next()	
normalize()	
previous()	
<pre>shrink()</pre>	
<pre>shuffle_down()</pre>	
<pre>shuffle_up()</pre>	

#### **Command documentation**

commands()	$\rightarrow$ list[str]
------------	-------------------------

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

## grow()

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## maximize()

 $\texttt{next()} \rightarrow None$ 

normalize()

 $previous() \rightarrow None$ 

shrink()

shuffle\_down()

shuffle\_up()

## 7.2.16 Zoomy

## class libqtile.layout.zoomy.Zoomy

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.layout.<command>() qtile cmd-obj -o layout -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of layout information
<pre>items(name)</pre>	Build a list of contained items for the given item class.
next()	
previous()	

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

**info()**  $\rightarrow$  dict[str, Any]

Returns a dictionary of layout information

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

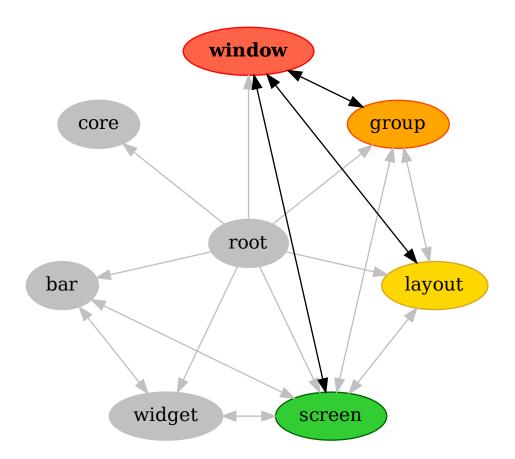

**next()**  $\rightarrow$  None

 $\texttt{previous()} \rightarrow \text{None}$ 

# 7.3 Window objects

The size and position of windows is determined by the current layout. Nevertheless, windows can still change their appearance in multiple ways (toggling floating state, fullscreen, opacity).

Windows can access objects relevant to the display of the window (i.e. the screen, group and layout).

## 

To access commands on this object via the command graph, use one of the following options:

lazy.window.<command>() qtile cmd-obj -o window -f <command>

The following commands are available for this object:

<pre>bring_to_front()</pre>	Bring the window to the front.
center()	Centers a floating window on the screen.
commands()	Returns a list of possible commands for this object
disable_floating()	Tile the window.

continues on next page

	u nom previous page
disable_fullscreen()	Un-fullscreen the window
<i>doc</i> (name)	Returns the documentation for a specified command
	name
down_opacity()	Decrease the window's opacity by 10%.
<pre>enable_floating()</pre>	Float the window.
<pre>enable_fullscreen()</pre>	Fullscreen the window
eval(code)	Evaluates code in the same context as this function
focus([warp])	Focus this window and optional warp the pointer to
(motion (for ation * and **1	it.
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
<pre>get_position()</pre>	Get the $(x, y)$ of the window
get_size()	Get the (width, height) of the window
info()	Return information on this window.
is_visible()	Is this window visible (i.e.
items(name)	Build a list of contained items for the given item class.
keep_above([enable])	Keep this window above all others
<pre>keep_below([enable])</pre>	Keep this window below all others
kill()	Kill the window
<pre>move_down([force])</pre>	Move this window below the previous window along the z axis.
<pre>move_floating(dx, dy)</pre>	Move window by dx and dy
move_to_bottom()	Move this window below all windows in the current
	layer e.g.
<pre>move_to_top()</pre>	Move this window above all windows in the current
	layer e.g.
<pre>move_up([force])</pre>	Move this window above the next window along the
	z axis.
<i>place</i> (x, y, width, height, borderwidth,)	Place the window in the given position.
resize_floating(dw, dh)	Add dw and dh to size of window
<pre>set_opacity(opacity)</pre>	Set the window's opacity
<pre>set_position(x, y)</pre>	Move floating window to x and y; swap tiling window
	with the window under the pointer.
<pre>set_position_floating(x, y)</pre>	Move window to x and y
<pre>set_size_floating(w, h)</pre>	Set window dimensions to w and h
<pre>static([screen, x, y, width, height])</pre>	Makes this window a static window, attached to a
	Screen.
<pre>toggle_floating()</pre>	Toggle the floating state of the window.
<pre>toggle_fullscreen()</pre>	Toggle the fullscreen state of the window.
toggle_maximize()	Toggle the fullscreen state of the window.
toggle_minimize()	Toggle the minimized state of the window.
<i>togroup</i> ([group_name, groupName,])	Move window to a specified group
toscreen([index])	Move window to a specified screen.
up_opacity()	Increase the window's opacity by 10%.

	Table	2 –	continued	from	previous	page
--	-------	-----	-----------	------	----------	------

### abstract bring\_to\_front() $\rightarrow$ None

Bring the window to the front.

In X11, *bring\_to\_front* ignores all other layering rules and brings the window to the very front. When that window loses focus, it will be stacked again according the appropriate rules.

## $\texttt{center()} \to None$

Centers a floating window on the screen.

```
commands() \rightarrow list[str]
     Returns a list of possible commands for this object
     Used by gsh for command completion and online help
abstract disable_floating() \rightarrow None
     Tile the window.
abstract disable_fullscreen() \rightarrow None
     Un-fullscreen the window
doc(name) \rightarrow str
     Returns the documentation for a specified command name
     Used by __qsh__ to provide online help.
down_opacity() \rightarrow None
     Decrease the window's opacity by 10%.
abstract enable_floating() \rightarrow None
     Float the window.
abstract enable_fullscreen() \rightarrow None
     Fullscreen the window
eval(code: str) \rightarrow tuple[bool, str | None]
     Evaluates code in the same context as this function
     Return value is tuple (success, result), success being a boolean and result being a string representing the
     return value of eval, or None if exec was used instead.
abstract focus(warp: bool = True) \rightarrow None
     Focus this window and optional warp the pointer to it.
function(function, *args, **kwargs) \rightarrow None
     Call a function with current object as argument
abstract get_position() \rightarrow tuple[int, int]
     Get the (x, y) of the window
abstract get_size() \rightarrow tuple[int, int]
     Get the (width, height) of the window
abstract info() \rightarrow dict[str, Any]
     Return information on this window.
     Mimimum required keys are: - name - x - y - width - height - group - id - wm_class
is_visible() → bool
     Is this window visible (i.e. not hidden)?
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
     Build a list of contained items for the given item class.
     Exposing this allows __qsh__ to navigate the command graph.
     Returns a tuple (root, items) for the specified item class, where:
          root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout"
          defaults to current layout), and False if it does not (e.g. no default "widget").
          items: a list of contained items
```

# keep\_above(enable: bool | None = None)

Keep this window above all others

## keep\_below(enable: bool | None = None)

Keep this window below all others

abstract kill()  $\rightarrow$  None

Kill the window

## **move\_down**(*force:* bool = False) $\rightarrow$ None

Move this window below the previous window along the z axis.

Will not lower a "normal" window (i.e. one that is not "kept\_above/below") below a window that is marked as "kept\_below".

Will not lower a window where "keep\_above" is True unless force is set to True.

## **abstract move\_floating**(dx: int, dy: int) $\rightarrow$ None

Move window by dx and dy

## $move_to_bottom() \rightarrow None$

Move this window below all windows in the current layer e.g. if you have 3 windows all with "keep\_above" set, calling this method will move the window to the bottom of those three windows.

Calling this on a "normal" window will not raise it below a "kept\_below" window.

## $\texttt{move\_to\_top()} \rightarrow None$

Move this window above all windows in the current layer e.g. if you have 3 windows all with "keep\_above" set, calling this method will move the window to the top of those three windows.

Calling this on a "normal" window will not raise it above a "kept\_above" window.

#### **move\_up**(*force:* bool = False) $\rightarrow$ None

Move this window above the next window along the z axis.

Will not raise a "normal" window (i.e. one that is not "kept\_above/below") above a window that is marked as "kept\_above".

Will not raise a window where "keep\_below" is True unless force is set to True.

# **abstract place**(*x*, *y*, *width*, *height*, *borderwidth*, *bordercolor*, *above=False*, *margin=None*, *respect hints=False*)

Place the window in the given position.

## **abstract resize\_floating**(dw: int, dh: int) $\rightarrow$ None

Add dw and dh to size of window

 $\texttt{set\_opacity}(\textit{opacity: float}) \rightarrow \texttt{None}$ 

Set the window's opacity

## **abstract set\_position**(*x: int*, *y: int*) $\rightarrow$ None

Move floating window to x and y; swap tiling window with the window under the pointer.

## **abstract set\_position\_floating**(*x: int, y: int*) $\rightarrow$ None

Move window to x and y

## **abstract** set\_size\_floating(w: int, h: int) $\rightarrow$ None

Set window dimensions to w and h

**abstract static**(*screen: int* | *None* = *None*, *x: int* | *None* = *None*, *y: int* | *None* = *None*, *width: int* | *None* = *None*, *height: int* | *None* = *None*)  $\rightarrow$  None

Makes this window a static window, attached to a Screen.

Values left unspecified are taken from the existing window state.

<code>abstract toggle\_floating()</code>  $\rightarrow$  None

Toggle the floating state of the window.

abstract toggle\_fullscreen()  $\rightarrow$  None

Toggle the fullscreen state of the window.

abstract toggle\_maximize()  $\rightarrow$  None

Toggle the fullscreen state of the window.

<code>abstract toggle\_minimize()</code>  $\rightarrow$  None

Toggle the minimized state of the window.

**abstract togroup**(group\_name: str | None = None, groupName: str | None = None, switch\_group: bool = False, toggle: bool = False)  $\rightarrow$  None

Move window to a specified group

Also switch to that group if *switch\_group* is True.

If *toggle* is True and and the specified group is already on the screen, use the last used group as target instead.

groupName is deprecated and will be dropped soon. Please use group\_name instead.

#### **Examples**

Move window to current group:

togroup()

Move window to group "a":

togroup("a")

Move window to group "a", and switch to group "a":

togroup("a", switch\_group=True)

**toscreen**(*index: int* | *None* = *None*)  $\rightarrow$  None

Move window to a specified screen.

If index is not specified, we assume the current screen

## **Examples**

Move window to current screen:

toscreen()

Move window to screen 0:

toscreen(≬)

 $\texttt{up_opacity()} \rightarrow None$ 

Increase the window's opacity by 10%.

# 7.4 Group objects

Groups are Qtile's workspaces. Groups are not responsible for the positioning of windows (that is handled by the *layouts*) so the available commands are somewhat more limited in scope.

Groups have access to the layouts in that group, the windows in the group and the screen displaying the group.

## class libqtile.group.\_Group

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.group.<command>() qtile cmd-obj -o group -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
focus_back()	Focus the window that had focus before the current one got it.
<pre>focus_by_index(index)</pre>	Change to the window at the specified index in the current group.
<pre>focus_by_name(name)</pre>	Focus the first window with the given name.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of info for this group
<pre>info_by_name(name)</pre>	Get the info for the first window with the given name without giving it focus.
items(name)	Build a list of contained items for the given item class.
next_window()	Focus the next window in group.
prev_window()	Focus the previous window in group.
<pre>set_label(label)</pre>	Set the display name of current group to be used in GroupBox widget.
<pre>setlayout(layout)</pre>	
<pre>swap_window_order(new_location)</pre>	Change the order of the current window within the current group.
<pre>switch_groups(name)</pre>	Switch position of current group with name
toscreen([screen, toggle])	Pull a group to a specified screen.
unminimize_all()	Unminimise all windows in this group

#### **Command documentation**

$commands() \rightarrow list[str]$
Returns a list of possible commands for this object
Used byqsh for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### focus\_back()

Focus the window that had focus before the current one got it.

Repeated calls to this function would basically continuously switch between the last two focused windows. Do nothing if less than 2 windows ever received focus.

#### **focus\_by\_index**(*index: int*) $\rightarrow$ None

Change to the window at the specified index in the current group.

#### focus\_by\_name(name)

Focus the first window with the given name. Do nothing if the name is not found.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Returns a dictionary of info for this group

#### info\_by\_name(name)

Get the info for the first window with the given name without giving it focus. Do nothing if the name is not found.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### next\_window()

Focus the next window in group.

Method cycles \_all\_ windows in group regardless if tiled in current layout or floating. Cycling of tiled and floating windows is not mixed. The cycling order depends on the current Layout.

#### prev\_window()

Focus the previous window in group.

Method cycles \_all\_ windows in group regardless if tiled in current layout or floating. Cycling of tiled and floating windows is not mixed. The cycling order depends on the current Layout.

## set\_label(label)

Set the display name of current group to be used in GroupBox widget. If label is None, the name of the group is used as display name. If label is the empty string, the group is invisible in GroupBox.

#### setlayout(layout)

#### swap\_window\_order(new\_location: int) → None

Change the order of the current window within the current group.

#### switch\_groups(name)

Switch position of current group with name

## toscreen(screen=None, toggle=False)

Pull a group to a specified screen.

## Parameters

## screen

Screen offset. If not specified, we assume the current screen.

## toggle

If this group is already on the screen, then the group is toggled with last used

## **Examples**

Pull group to the current screen:

toscreen()

Pull group to screen 0:

toscreen(≬)

## unminimize\_all()

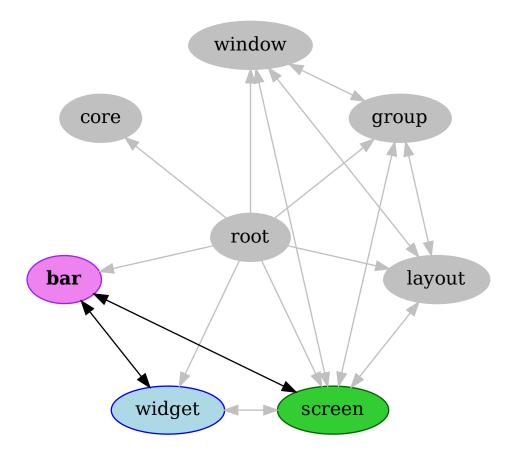

Unminimise all windows in this group

# 7.5 Bar objects

The bar is primarily used to display widgets on the screen. As a result, the bar does not need many of its own commands.

To select a bar on the command graph, you must use a selector (as there is no default bar). The selector is the position of the bar on the screen i.e. "top", "bottom", "left" or "right".

The bar can access the screen it's on and the widgets it contains via the command graph.

## class libqtile.bar.Bar

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.bar["position"].<command>()
qtile cmd-obj -o bar position -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>fake_button_press(screen, position, x, y[,])</pre>	Fake a mouse-button-press on the bar.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**fake\_button\_press**(*screen: int, position: str, x: int, y: int, button: int = 1*)  $\rightarrow$  None

Fake a mouse-button-press on the bar. Co-ordinates are relative to the top-left corner of the bar.

#### **Parameters**

widgets A list of widget objects.

size

The "thickness" of the bar, i.e. the height of a horizontal bar, or the width of a vertical bar.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

**info()**  $\rightarrow$  dict[str, Any]

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

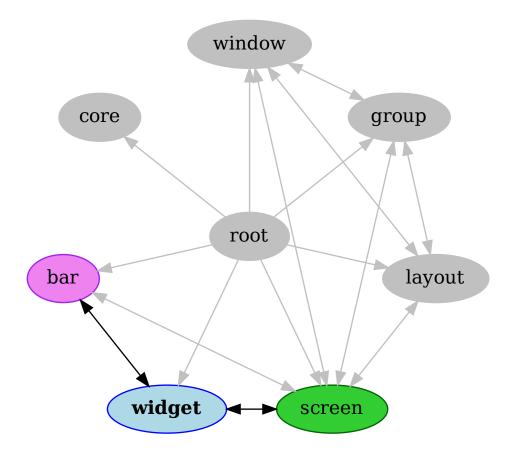

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6 Widget objects

Widgets are small scripts that are used to provide content or add functionality to the bar. Some widgets will expose commands in order for functionality to be triggered indirectly (e.g. via a keypress).

Widgets can access the parent bar and screen via the command graph.

# 7.6.1 AGroupBox

## class libqtile.widget.groupbox.AGroupBox

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["agroupbox"].<command>() qtile cmd-obj -o widget agroupbox -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.2 Backlight

#### class libqtile.widget.backlight.Backlight

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["backlight"].<command>()
qtile cmd-obj -o widget backlight -f <command>

The following commands are available for this object:

<pre>change_backlight(direction[, step])</pre>	
commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

### change\_backlight(direction, step=None)

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.3 Battery

#### class libqtile.widget.battery.Battery

#### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["battery"].<command>()
qtile cmd-obj -o widget battery -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.4 Batterylcon

## class libqtile.widget.battery.BatteryIcon

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["batteryicon"].<command>()
qtile cmd-obj -o widget batteryicon -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

## **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

 $doc(name) \rightarrow str$ 

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.5 Bluetooth

## class libqtile.widget.bluetooth.Bluetooth

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["bluetooth"].<command>()
qtile cmd-obj -o widget bluetooth -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

**set\_font**(*font=UNSPECIFIED*, *fontsize=UNSPECIFIED*, *fontshadow=UNSPECIFIED*)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.6 CPU

## class libqtile.widget.cpu.CPU

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["cpu"].<command>() qtile cmd-obj -o widget cpu -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.7 CPUGraph

## class libqtile.widget.graph.CPUGraph

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["cpugraph"].<command>() qtile cmd-obj -o widget cpugraph -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

#### **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.8 Canto

## class libqtile.widget.canto.Canto

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["canto"].<command>()
qtile cmd-obj -o widget canto -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
\verb+set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.9 CapsNumLockIndicator

class libqtile.widget.caps\_num\_lock\_indicator.CapsNumLockIndicator

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["capsnumlockindicator"].<command>() qtile cmd-obj -o widget capsnumlockindicator -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.10 CheckUpdates

#### class libqtile.widget.check\_updates.CheckUpdates

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["checkupdates"].<command>() qtile cmd-obj -o widget checkupdates -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.11 Chord

## class libqtile.widget.chord.Chord

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["chord"].<command>()
qtile cmd-obj -o widget chord -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.12 Clipboard

### class libqtile.widget.clipboard.Clipboard

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["clipboard"].<command>() qtile cmd-obj -o widget clipboard -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.13 Clock

## class libqtile.widget.clock.Clock

#### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["clock"].<command>()
qtile cmd-obj -o widget clock -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
function(function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

# 7.6.14 Cmus

#### class libqtile.widget.cmus.Cmus

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["cmus"].<command>()
qtile cmd-obj -o widget cmus -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

```
doc(name) \rightarrow str
```

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.15 Countdown

#### class libqtile.widget.countdown.Countdown

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["countdown"].<command>()
qtile cmd-obj -o widget countdown -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

# 7.6.16 CryptoTicker

### class libqtile.widget.crypto\_ticker.CryptoTicker

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["cryptoticker"].<command>()
qtile cmd-obj -o widget cryptoticker -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.17 CurrentLayout

## class libqtile.widget.currentlayout.CurrentLayout

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["currentlayout"].<command>() qtile cmd-obj -o widget currentlayout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

# 7.6.18 CurrentLayoutIcon

### class libqtile.widget.currentlayout.CurrentLayoutIcon

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["currentlayouticon"].<command>() qtile cmd-obj -o widget currentlayouticon -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.19 CurrentScreen

#### class libqtile.widget.currentscreen.CurrentScreen

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["currentscreen"].<command>() qtile cmd-obj -o widget currentscreen -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font (font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

# 7.6.20 DF

## class libqtile.widget.df.DF

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["df"].<command>()
qtile cmd-obj -o widget df -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.21 GenPollCommand

#### class libqtile.widget.generic\_poll\_text.GenPollCommand

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["genpollcommand"].<command>()
qtile cmd-obj -o widget genpollcommand -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

```
doc(name) \rightarrow str
```

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.22 GenPollText

#### class libqtile.widget.generic\_poll\_text.GenPollText

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["genpolltext"].<command>()
qtile cmd-obj -o widget genpolltext -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.23 GenPollUrl

### class libqtile.widget.generic\_poll\_text.GenPollUrl

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["genpollurl"].<command>() qtile cmd-obj -o widget genpollurl -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.24 GmailChecker

## class libqtile.widget.gmail\_checker.GmailChecker

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["gmailchecker"].<command>() qtile cmd-obj -o widget gmailchecker -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.25 GroupBox

### class libqtile.widget.groupbox.GroupBox

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["groupbox"].<command>()
qtile cmd-obj -o widget groupbox -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.26 HDDBusyGraph

#### class libqtile.widget.graph.HDDBusyGraph

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["hddbusygraph"].<command>() qtile cmd-obj -o widget hddbusygraph -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.

#### **Command documentation**

**commands**()  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.27 HDDGraph

## class libqtile.widget.graph.HDDGraph

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["hddgraph"].<command>()
qtile cmd-obj -o widget hddgraph -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

#### **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.28 IdleRPG

#### class libqtile.widget.idlerpg.IdleRPG

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["idlerpg"].<command>()
qtile cmd-obj -o widget idlerpg -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands**()  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.29 Image

### class libqtile.widget.image.Image

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["image"].<command>()
qtile cmd-obj -o widget image -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
update(filename)	

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

update(filename)

## 7.6.30 ImapWidget

#### class libqtile.widget.imapwidget.ImapWidget

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["imapwidget"].<command>()
qtile cmd-obj -o widget imapwidget -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.31 KeyboardKbdd

#### class libqtile.widget.keyboardkbdd.KeyboardKbdd

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["keyboardkbdd"].<command>() qtile cmd-obj -o widget keyboardkbdd -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

### info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.32 KeyboardLayout

## class libqtile.widget.keyboardlayout.KeyboardLayout

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["keyboardlayout"].<command>() qtile cmd-obj -o widget keyboardlayout -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
next_keyboard()	set the next layout in the list of configured keyboard
	layouts as new current layout in use
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

### **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### next\_keyboard()

set the next layout in the list of configured keyboard layouts as new current layout in use

If the current keyboard layout is not in the list, it will set as new layout the first one in the list.

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.33 KhalCalendar

### class libqtile.widget.khal\_calendar.KhalCalendar

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["khalcalendar"].<command>() qtile cmd-obj -o widget khalcalendar -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

## $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.34 LaunchBar

## class libqtile.widget.launchbar.LaunchBar

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["launchbar"].<command>() qtile cmd-obj -o widget launchbar -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

 $doc(name) \rightarrow str$ 

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.35 Load

## class libqtile.widget.load.Load

### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["load"].<command>()
qtile cmd-obj -o widget load -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
next_load()	
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

 $doc(name) \rightarrow str$ 

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### next\_load()

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.36 Maildir

## class libqtile.widget.maildir.Maildir

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["maildir"].<command>()
qtile cmd-obj -o widget maildir -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.37 Memory

#### class libqtile.widget.memory.Memory

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["memory"].<command>()
qtile cmd-obj -o widget memory -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

### info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.38 MemoryGraph

## class libqtile.widget.graph.MemoryGraph

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["memorygraph"].<command>() qtile cmd-obj -o widget memorygraph -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.39 Mirror

## class libqtile.widget.base.Mirror

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["mirror"].<command>() qtile cmd-obj -o widget mirror -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.6.40 Moc

## class libqtile.widget.moc.Moc

## API commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["moc"].<command>()
qtile cmd-obj -o widget moc -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

## **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

```
function(function, *args, **kwargs) \rightarrow None
```

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

# 7.6.41 Mpd2

#### class libqtile.widget.mpd2widget.Mpd2

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["mpd2"].<command>()
qtile cmd-obj -o widget mpd2 -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.6.42 Mpris2

### class libqtile.widget.mpris2widget.Mpris2

### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["mpris2"].<command>()
qtile cmd-obj -o widget mpris2 -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	What's the current state of the widget?
<pre>items(name)</pre>	Build a list of contained items for the given item class.
next()	Play the next track.
play_pause()	Toggle the playback status.
previous()	Play the previous track.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
stop()	Stop playback.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

What's the current state of the widget?

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
next() \rightarrow None
```

Play the next track.

```
play_pause() \rightarrow None
```

Toggle the playback status.

## $previous() \rightarrow None$

Play the previous track.

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

 $stop() \rightarrow None$ 

Stop playback.

# 7.6.43 Net

## class libqtile.widget.net.Net

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["net"].<command>()
qtile cmd-obj -o widget net -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.44 NetGraph

### class libqtile.widget.graph.NetGraph

### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["netgraph"].<command>() qtile cmd-obj -o widget netgraph -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.45 Notify

## class libqtile.widget.notify.Notify

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["notify"].<command>()
qtile cmd-obj -o widget notify -f <command>

The following commands are available for this object:

clear([reason])	Clear the notification
commands()	Returns a list of possible commands for this object
display()	
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
info()	Info for this object.
invoke()	Invoke the notification's default action
<i>items</i> (name)	Build a list of contained items for the given item class.
next()	
prev()	Show previous notification.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
toggle()	Toggle showing/clearing the notification

#### **Command documentation**

#### clear(reason=2)

Clear the notification

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## display()

```
doc(name) \rightarrow str
```

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

## invoke()

Invoke the notification's default action

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

next()

#### prev()

Show previous notification.

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

toggle()

Toggle showing/clearing the notification

## 7.6.46 NvidiaSensors

### class libqtile.widget.nvidia\_sensors.NvidiaSensors

### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["nvidiasensors"].<command>()
qtile cmd-obj -o widget nvidiasensors -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

## 7.6.47 OpenWeather

## class libqtile.widget.open\_weather.OpenWeather

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["openweather"].<command>()
qtile cmd-obj -o widget openweather -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### eval(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

#### **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.48 Pomodoro

### class libqtile.widget.pomodoro.Pomodoro

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["pomodoro"].<command>() qtile cmd-obj -o widget pomodoro -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
<pre>toggle_active()</pre>	

toggle\_break()

## **Command documentation**

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

Change the folit used by this widget. If folit is fyolic, the current

toggle\_active()

toggle\_break()

## 7.6.49 Prompt

#### class libqtile.widget.prompt.Prompt

### API commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["prompt"].<command>()
qtile cmd-obj -o widget prompt -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>exec_general(prompt, object_name, cmd_name)</pre>	Execute a cmd of any object.
<pre>fake_keypress(key)</pre>	
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of info for this object
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

exec\_general(prompt, object\_name, cmd\_name, selector=None, completer=None)

Execute a cmd of any object. For example layout, group, window, widget, etc with a string that is obtained from start\_input.

#### **Parameters**

#### prompt

Text displayed at the prompt.

#### object\_name

Name of a object in Qtile. This string has to be 'layout', 'widget', 'bar', 'window' or 'screen'.

## cmd\_name

Execution command of selected object using object\_name and selector.

#### selector

This value select a specific object within a object list that is obtained by object\_name. If this value is None, current object is selected. e.g. current layout, current window and current screen.

#### completer:

Completer to use.

#### config example:

Key([alt, 'shift'], 'a',

lazy.widget['prompt'].exec\_general(
 'section(add)', 'layout', 'add\_section'))

#### $fake_keypress(key: str) \rightarrow None$

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### info()

Returns a dictionary of info for this object

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.50 PulseVolume

#### class libqtile.widget.pulse\_volume.PulseVolume

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["pulsevolume"].<command>() qtile cmd-obj -o widget pulsevolume -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
decrease_vol([value])	Decrease volume.
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
<pre>increase_vol([value])</pre>	Increase volume.
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
mute()	Mute the sound device.
<pre>run_app()</pre>	
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### decrease\_vol(value=None)

Decrease volume.

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## increase\_vol(value=None)

Increase volume.

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

#### mute()

Mute the sound device.

## run\_app()

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.51 QuickExit

### class libqtile.widget.quick\_exit.QuickExit

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["quickexit"].<command>()
qtile cmd-obj -o widget quickexit -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
trigger()	

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

## $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

trigger()

## 7.6.52 Sep

## class libqtile.widget.sep.Sep

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["sep"].<command>()
qtile cmd-obj -o widget sep -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.53 She

## class libqtile.widget.she.She

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["she"].<command>()
qtile cmd-obj -o widget she -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

### **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

## 7.6.54 Spacer

### class libqtile.widget.spacer.Spacer

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["spacer"].<command>()
qtile cmd-obj -o widget spacer -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.

#### **Command documentation**

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.55 StatusNotifier

## class libqtile.widget.statusnotifier.StatusNotifier

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["statusnotifier"].<command>() qtile cmd-obj -o widget statusnotifier -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.

## **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.56 StockTicker

## class libqtile.widget.stock\_ticker.StockTicker

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["stockticker"].<command>() qtile cmd-obj -o widget stockticker -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.57 SwapGraph

#### class libqtile.widget.graph.SwapGraph

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["swapgraph"].<command>() qtile cmd-obj -o widget swapgraph -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

#### **commands()** $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.58 Systray

#### class libqtile.widget.systray.Systray

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["systray"].<command>() qtile cmd-obj -o widget systray -f <command>

_window_mask	
commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>focus</i> ([warp])	Focuses the window.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
get_hints()	Returns the X11 hints (WM_HINTS and WM_SIZE_HINTS) for this window.
inspect()	Tells you more than you ever wanted to know about a window
items(name)	Build a list of contained items for the given item class.
keep_above([enable])	
<pre>keep_below([enable])</pre>	
kill()	
<pre>move_down([force])</pre>	
<pre>move_to_bottom([force])</pre>	
<pre>move_to_top([force])</pre>	
<pre>move_up([force])</pre>	
<i>place</i> (x, y, width, height, borderwidth,)	Places the window at the specified location with the given size.

## \_window\_mask(\*\*kwargs)

int([x]) -> integer int(x, base=10) -> integer

Convert a number or string to an integer, or return 0 if no arguments are given. If x is a number, return x.\_\_int\_\_(). For floating point numbers, this truncates towards zero.

If x is not a number or if base is given, then x must be a string, bytes, or bytearray instance representing an integer literal in the given base. The literal can be preceded by '+' or '-' and be surrounded by whitespace. The base defaults to 10. Valid bases are 0 and 2-36. Base 0 means to interpret the base from the string as an integer literal. >>> int('0b100', base=0) 4

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**focus**(*warp: bool* = True)  $\rightarrow$  None

Focuses the window.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### get\_hints()

Returns the X11 hints (WM\_HINTS and WM\_SIZE\_HINTS) for this window.

#### inspect()

Tells you more than you ever wanted to know about a window

```
items(name: str) \rightarrow tuple[bool, list[str | int] | None]
```

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

keep\_above(enable: bool | None = None)

keep\_below(enable: bool | None = None)

kill()

move\_down(force=False)

move\_to\_bottom(force=False)

move\_to\_top(force=False)

move\_up(force=False)

**place**(*x*, *y*, *width*, *height*, *borderwidth*, *bordercolor*, *above=False*, *margin=None*, *respect\_hints=False*) Places the window at the specified location with the given size.

#### Parameters

x: int y: int width: int height: int borderwidth: int bordercolor: string above: bool, optional margin: int or list, optional space around window as int or list of ints [N E S W]

#### above: bool, optional

If True, the geometry will be adjusted to respect hints provided by the client.

## 7.6.59 TaskList

### class libqtile.widget.tasklist.TaskList

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["tasklist"].<command>() qtile cmd-obj -o widget tasklist -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## 7.6.60 TextBox

### class libqtile.widget.textbox.TextBox

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["textbox"].<command>() qtile cmd-obj -o widget textbox -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
get()	Retrieve the text in a TextBox widget
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
update(text)	Update the widget text.

#### **Command documentation**

 $\textbf{commands()} \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## get()

Retrieve the text in a TextBox widget

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

### update(text)

Update the widget text.

## 7.6.61 ThermalSensor

#### class libqtile.widget.sensors.ThermalSensor

#### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["thermalsensor"].<command>() qtile cmd-obj -o widget thermalsensor -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>function(function, *args, **kwargs)</pre>	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.62 ThermalZone

#### class libqtile.widget.thermal\_zone.ThermalZone

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["thermalzone"].<command>() qtile cmd-obj -o widget thermalzone -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.63 Volume

## class libqtile.widget.volume.Volume

### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["volume"].<command>() qtile cmd-obj -o widget volume -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
decrease_vol()	
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
increase_vol()	
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>mute()</pre>	
<pre>run_app()</pre>	
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### decrease\_vol()

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

```
eval(code: str) \rightarrow tuple[bool, str | None]
```

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

### increase\_vol()

#### info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

## mute()

run\_app()

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

## 7.6.64 Wallpaper

#### class libqtile.widget.wallpaper.Wallpaper

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["wallpaper"].<command>() qtile cmd-obj -o widget wallpaper -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### $doc(name) \rightarrow str$

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.65 WidgetBox

#### class libqtile.widget.widgetbox.WidgetBox

### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["widgetbox"].<command>() qtile cmd-obj -o widget widgetbox -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.
toggle()	Toggle box state

### **Command documentation**

```
commands() \rightarrow list[str]
```

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

#### toggle()

Toggle box state

## 7.6.66 WindowCount

#### class libqtile.widget.window\_count.WindowCount

### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["windowcount"].<command>() qtile cmd-obj -o widget windowcount -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
get()	Retrieve the current text.
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### **commands**() $\rightarrow$ list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

#### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

## get()

Retrieve the current text.

### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.67 WindowName

#### class libqtile.widget.windowname.WindowName

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["windowname"].<command>() qtile cmd-obj -o widget windowname -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

#### **eval**(*code: str*) $\rightarrow$ tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

## 7.6.68 WindowTabs

### class libqtile.widget.windowtabs.WindowTabs

### **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["windowtabs"].<command>() qtile cmd-obj -o widget windowtabs -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
<i>items</i> (name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

## **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

 $doc(name) \rightarrow str$ 

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

#### info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
Change the font used by this widget. If font is None, the current font is used.

## 7.6.69 Wlan

## class libqtile.widget.wlan.Wlan

## **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.widget["wlan"].<command>() qtile cmd-obj -o widget wlan -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

## $\textbf{commands()} \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

### **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

info()

Info for this object.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

```
set_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)
```

Change the font used by this widget. If font is None, the current font is used.

## 7.6.70 Wttr

## class libqtile.widget.wttr.Wttr

#### **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.widget["wttr"].<command>() qtile cmd-obj -o widget wttr -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<pre>force_update()</pre>	Immediately poll the widget.
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Info for this object.
items(name)	Build a list of contained items for the given item class.
<pre>set_font([font, fontsize, fontshadow])</pre>	Change the font used by this widget.

#### **Command documentation**

#### $commands() \rightarrow list[str]$

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## force\_update()

Immediately poll the widget. Existing timers are unaffected.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

## info()

Info for this object.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

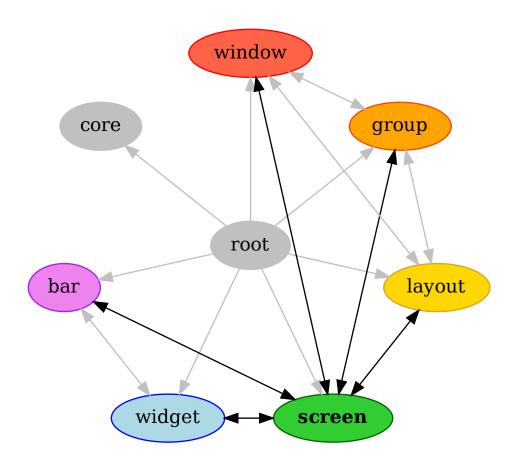

set\_font(font=UNSPECIFIED, fontsize=UNSPECIFIED, fontshadow=UNSPECIFIED)

Change the font used by this widget. If font is None, the current font is used.

# 7.7 Screen objects

Screens are the display area that holds bars and an active group. Screen commands include changing the current group and changing the wallpaper.

Screens can access objects displayed on that screen e.g. bar, widgets, groups, layouts and windows.

## class libqtile.config.Screen

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.screen.<command>() qtile cmd-obj -o screen -f <command>

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Returns a dictionary of info for this screen.
<pre>items(name)</pre>	Build a list of contained items for the given item class.
<pre>next_group([skip_empty, skip_managed])</pre>	Switch to the next group
<pre>prev_group([skip_empty, skip_managed, warp])</pre>	Switch to the previous group
<pre>resize([x, y, w, h])</pre>	
<pre>set_wallpaper(path[, mode])</pre>	Set the wallpaper to the given file.
<pre>toggle_group([group_name, warp])</pre>	Switch to the selected group or to the previously ac-
	tive one

 $commands() \rightarrow list[str]$ 

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

## **function**(*function*, \**args*, \*\**kwargs*) $\rightarrow$ None

Call a function with current object as argument

```
info() \rightarrow dict[str, int]
```

Returns a dictionary of info for this screen.

**items**(*name: str*)  $\rightarrow$  tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

**next\_group**(*skip\_empty: bool* = *False*, *skip\_managed: bool* = *False*)  $\rightarrow$  None

Switch to the next group

**prev\_group**(*skip\_empty: bool = False, skip\_managed: bool = False, warp: bool = True*)  $\rightarrow$  None Switch to the previous group

**resize**(*x*: *int* | *None* = *None*, *y*: *int* | *None* = *None*, *w*: *int* | *None* = *None*, *h*: *int* | *None* = *None*)  $\rightarrow$  None

**set\_wallpaper**(*path: str, mode: str* | *None* = *None*)  $\rightarrow$  None Set the wallpaper to the given file.

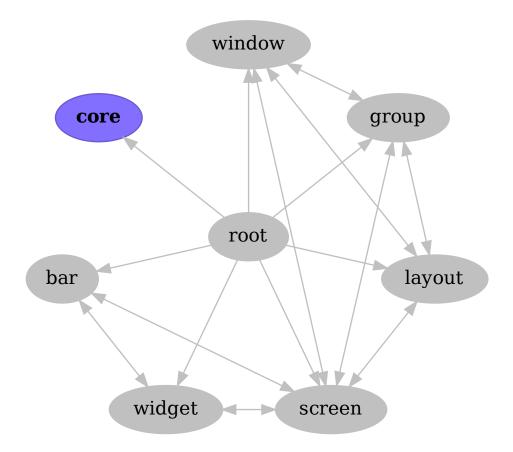

**toggle\_group**(*group\_name: str* | *None* = *None*, *warp: bool* = *True*)  $\rightarrow$  None Switch to the selected group or to the previously active one

# 7.8 Backend core objects

The backend core is the link between the Qtile objects (windows, layouts, groups etc.) and the specific backend (X11 or Wayland). This core should be largely invisible to users and, as a result, these objects do not expose many commands.

Nevertheless, both backends do contain important commands, notably set\_keymap on X11 and change\_vt used to change to a different TTY on Wayland.

The backend core has no access to other nodes on the command graph.

# 7.8.1 X11 backend

## class libqtile.backend.x11.core.Core

# **API** commands

To access commands on this object via the command graph, use one of the following options:

lazy.core.<command>() qtile cmd-obj -o core -f <command>

The following commands are available for this object:

commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command
	name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
info()	Get basic information about the running backend.
items(name)	Build a list of contained items for the given item class.

# **Command documentation**

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

**doc**(*name*)  $\rightarrow$  str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

**eval**(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

**info()**  $\rightarrow$  dict[str, Any]

Get basic information about the running backend.

**items**(*name: str*) → tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# 7.8.2 Wayland backend

## class libqtile.backend.wayland.core.Core

## **API commands**

To access commands on this object via the command graph, use one of the following options:

lazy.core.<command>() qtile cmd-obj -o core -f <command>

The following commands are available for this object:

change_vt(vt)	Change virtual terminal to that specified
commands()	Returns a list of possible commands for this object
<i>doc</i> (name)	Returns the documentation for a specified command name
eval(code)	Evaluates code in the same context as this function
<i>function</i> (function, *args, **kwargs)	Call a function with current object as argument
<pre>get_inputs()</pre>	Get information on all input devices.
hide_cursor()	Hide the cursor.
info()	Get basic information about the running backend.
items(name)	Build a list of contained items for the given item class.
<pre>query_tree()</pre>	Get IDs of all mapped windows in ascending Z order.
<pre>set_keymap([layout, options, variant])</pre>	Set the keymap for the current keyboard.
unhide_cursor()	Unhide the cursor.

# **Command documentation**

#### **change\_vt**(*vt: int*) $\rightarrow$ bool

Change virtual terminal to that specified

**commands()**  $\rightarrow$  list[str]

Returns a list of possible commands for this object

Used by \_\_qsh\_\_ for command completion and online help

#### **doc**(*name*) $\rightarrow$ str

Returns the documentation for a specified command name

Used by \_\_qsh\_\_ to provide online help.

eval(*code: str*)  $\rightarrow$  tuple[bool, str | None]

Evaluates code in the same context as this function

Return value is tuple (*success, result*), success being a boolean and result being a string representing the return value of eval, or None if exec was used instead.

**function**(*function*, \**args*, \*\**kwargs*)  $\rightarrow$  None

Call a function with current object as argument

 $\texttt{get\_inputs()} \rightarrow dict[str, list[dict[str, str]]]$ 

Get information on all input devices.

**hide\_cursor()**  $\rightarrow$  None

Hide the cursor.

## **info()** $\rightarrow$ dict[str, Any]

Get basic information about the running backend.

# **items**(*name: str*) $\rightarrow$ tuple[bool, list[str | int] | None]

Build a list of contained items for the given item class.

Exposing this allows \_\_qsh\_\_ to navigate the command graph.

Returns a tuple (root, items) for the specified item class, where:

root: True if this class accepts a "naked" specification without an item seletion (e.g. "layout" defaults to current layout), and False if it does not (e.g. no default "widget").

items: a list of contained items

# query\_tree() $\rightarrow$ list[int]

Get IDs of all mapped windows in ascending Z order.

set\_keymap(*layout: str* | *None* = *None*, *options: str* | *None* = *None*, *variant: str* | *None* = *None*)  $\rightarrow$  None Set the keymap for the current keyboard.

The options correspond to xkbcommon configuration environmental variables and if not specified are taken from the environment. Acceptable values are strings identical to those accepted by the env variables.

# $\texttt{unhide\_cursor()} \rightarrow None$

Unhide the cursor.

# CHAPTER

# EIGHT

# **DEFAULT CONFIG FILE**

The below default config file is included with the Qtile package and will be copied to your home config folder (~/.con-fig/qtile/config.py) if no config file exists when you start Qtile for the first time.

```

# CHAPTER

# NINE

# THE CONFIG FILE

Qtile is configured in Python. A script (~/.config/qtile/config.py by default) is evaluated, and a small set of configuration variables are pulled from its global namespace.

# 9.1 Configuration lookup order

Qtile looks in the following places for a configuration file, in order:

- The location specified by the -c argument.
- \$XDG\_CONFIG\_HOME/qtile/config.py, if it is set
- ~/.config/qtile/config.py
- It reads the module libqtile.resources.default\_config, included by default with every Qtile installation.

Qtile will try to create the configuration file as a copy of the default config, if it doesn't exist yet.

# 9.2 Default Configuration

The *default configuration* is invoked when qtile cannot find a configuration file. In addition, if qtile is restarted or the config is reloaded, qtile will load the default configuration if the config file it finds has some kind of error in it. The documentation below describes the configuration lookup process, as well as what the key bindings are in the default config.

The default config is not intended to be suitable for all users; it's mostly just there so quile does /something/ when fired up, and so that it doesn't crash and cause you to lose all your work if you reload a bad config.

# 9.3 Configuration variables

A Qtile configuration consists of a file with a bunch of variables in it, which qtile imports and then runs as a Python file to derive its final configuration. The documentation below describes the most common configuration variables; more advanced configuration can be found in the qtile-examples repository, which includes a number of real-world configurations that demonstrate how you can tune Qtile to your liking. (Feel free to issue a pull request to add your own configuration to the mix!)

# 9.3.1 Lazy objects

Lazy objects are a way of executing any of the commands available in Qtile's commands API.

The name "lazy" refers to the fact that the commands are not executed at the time of the call. Instead, the lazy object creates a reference to the relevant command and this is only executed when the relevant event is triggered (e.g. on a keypress).

Typically, for config files, the commands are used to manipulate windows, layouts and groups as well application commands like exiting, reloading the config file etc.

# Example

```
from libqtile.config import Key
from libqtile.lazy import lazy
keys = [
    Key(
       ["mod1"], "k",
       lazy.layout.down()
    ),
    Key(
       ["mod1"], "j",
       lazy.layout.up()
    )
]
```

**Note:** As noted above, lazy calls do not call the relevant command but only create a reference to it. While this makes it ideal for binding commands to key presses and mouse\_callbacks for widgets, it also means that lazy calls cannot be included in user-defined functions.

# Lazy functions

This is overview of the commonly used functions for the key bindings. These functions can be called from commands on the REPLACE object or on another object in the command tree.

Some examples are given below. For a complete list of available commands, please refer to Commands API.

# **General functions**

function	description	
lazy. spawn("applicatio	Run the application	
lazy.spawncmd()	Open command prompt on the bar. See prompt widget.	
lazy. reload_config()	Reload the config.	
lazy.restart()	Restart Qtile. In X11, it won't close your windows.	
<pre>lazy.shutdown()</pre>	Close the whole Qtile	

# Group functions

function	description
<pre>lazy. next_layout()</pre>	Use next layout on the actual group
lazy. prev_layout()	Use previous layout on the actual group
<pre>lazy.screen. next_group()</pre>	Move to the group on the right
<pre>lazy.screen. prev_group()</pre>	Move to the group on the left
<pre>lazy.screen. toggle_group()</pre>	Move to the last visited group
<pre>lazy.group. next_window()</pre>	Switch window focus to next window in group
<pre>lazy.group. prev_window()</pre>	Switch window focus to previous window in group
<pre>lazy. group["group_name toscreen()</pre>	Move to the group called group_name. Takes an optional toggle parameter (defaults to False). If this group is already on the screen, it does nothing by default; to toggle with the last used group instead, use toggle=True.
<pre>lazy.layout. increase_ratio()</pre>	Increase the space for master window at the expense of slave windows
<pre>lazy.layout. decrease_ratio()</pre>	Decrease the space for master window in the advantage of slave windows

# Window functions

function	description
lazy.window. kill()	Close the focused window
lazy.layout. next()	Switch window focus to other pane(s) of stack
<pre>lazy.window. togroup("group_na</pre>	Move focused window to the group called group_name
<pre>lazy.window. toggle_floating()</pre>	Put the focused window to/from floating mode
<pre>lazy.window. toggle_fullscreen</pre>	Put the focused window to/from fullscreen mode
<pre>lazy.window. move_up()</pre>	Move the window above the next window in the stack.
<pre>lazy.window. move_down()</pre>	Move the window below the previous window in the stack.
<pre>lazy.window. move_to_top()</pre>	Move the window above all other windows with similar priority (i.e. a "normal" window will not be moved above a kept_above window).
<pre>lazy.window. move_to_bottom()</pre>	Move the window below all other windows with similar priority (i.e. a "normal" window will not be moved below a kept_below window).
<pre>lazy.window. keep_above()</pre>	Keep window above other windows.
<pre>lazy.window. keep_below()</pre>	Keep window below other windows.
<pre>lazy.window. bring_to_front()</pre>	Bring window above all other windows. Ignores kept_above priority.

# **Screen functions**

function	description
<pre>lazy.screen. set_wallpaper(pat mode=None)</pre>	Set the wallpaper to the specificied image. Possible modes: None no resizing, 'fill' centre and resize to fill screen, 'stretch' stretch to fill screen.

# ScratchPad DropDown functions

function	description
<pre>lazy. group["group_name dropdown_toggle("</pre>	Toggles the visibility of the specified DropDown window. On first use, the configured process is spawned.
lazy. group["group_name hide_all()	Hides all DropDown windows.
<pre>lazy. group["group_name dropdown_reconfig</pre>	Update the configuration of the named DropDown.
**configuration)	

# **User-defined functions**

function	description
<pre>lazy. function(func, *args, **kwargs)</pre>	Calls func(qtile, *args, **kwargs). NB. the qtile object is automatically passed as the first argument.

## **Examples**

lazy.function can also be used as a decorator for functions.

Additionally, you can pass arguments to user-defined function in one of two ways:

1) In-line definition

Arguments can be added to the lazy.function call.

```
from libqtile.config import Key
from libqtile.lazy import lazy
```

```
from libqtile.log_utils import logger

def multiply(qtile, value, multiplier=10):
    logger.warning(f"Multiplication results: {value * multiplier}")
keys = [
    Key(
        ["mod1"], "k",
        lazy.function(multiply, 10, multiplier=2)
    )
]
```

2) Decorator

Arguments can also be passed to the decorated function.

```
from libqtile.config import Key
from libqtile.lazy import lazy
from libqtile.log_utils import logger
@lazy.function
def multiply(qtile, value, multiplier=10):
    logger.warning(f"Multiplication results: {value * multiplier}")
keys = [
    Key(
        ["mod1"], "k",
        multiply(10, multiplier=2)
    )
]
```

# 9.3.2 Groups

A group is a container for a bunch of windows, analogous to workspaces in other window managers. Each client window managed by the window manager belongs to exactly one group. The groups config file variable should be initialized to a list of Group objects.

Group objects provide several options for group configuration. Groups can be configured to show and hide themselves when they're not empty, spawn applications for them when they start, automatically acquire certain groups, and various other options.

# Example

```
from libqtile.config import Group, Match
groups = [
    Group("a"),
    Group("b"),
    Group("c", matches=[Match(wm_class=["Firefox"])]),
]
```

```
# allow mod3+1 through mod3+0 to bind to groups; if you bind your groups
# by hand in your config, you don't need to do this.
from libqtile.dgroups import simple_key_binder
```

dgroups\_key\_binder = simple\_key\_binder("mod3")

#### Reference

#### Group

class libqtile.config.Group(name: str, matches: list[Match] | None = None, exclusive: bool = False, spawn: str | list[str] | None = None, layout: str | None = None, layouts: list[Layout] | None = None, persist: bool = True, init: bool = True, layout\_opts: dict[str, Any] | None = None, screen\_affinity: int | None = None, position: int = 9223372036854775807, label: str | None = None)

Represents a "dynamic" group

These groups can spawn apps, only allow certain Matched windows to be on them, hide when they're not in use, etc. Groups are identified by their name.

#### **Parameters**

#### name:

The name of this group.

#### matches:

List of Match objects whose matched windows will be assigned to this group.

#### exclusive:

When other apps are started in this group, should we allow them here or not?

#### spawn:

This will be executed (via qtile.spawn()) when the group is created. You can pass either a program name or a list of programs to exec().

### layout:

The name of default layout for this group (e.g. "max"). This is the name specified for a particular layout in config.py or if not defined it defaults in general to the class name in all lower case.

#### layouts:

The group layouts list overriding global layouts. Use this to define a separate list of layouts for this particular group.

#### persist:

Should this group stay alive when it has no member windows?

#### init:

Should this group be alive when Qtile starts?

## layout\_opts:

Options to pass to a layout.

#### screen\_affinity:

Make a dynamic group prefer to start on a specific screen.

#### position:

The position of this group.

#### label:

The display name of the group. Use this to define a display name other than name of the group. If set to None, the display name is set to the name.

#### libqtile.dgroups.simple\_key\_binder(mod, keynames=None)

Bind keys to mod+group position or to the keys specified as second argument

# **Group Matching**

# Match

Window properties to compare (match) with a window.

The properties will be compared to a Window to determine if its properties *match*. It can match by title, wm\_class, role, wm\_type, wm\_instance\_class, net\_wm\_pid, or wid. Additionally, a function may be passed, which takes in the Window to be compared against and returns a boolean.

For some properties, Match supports both regular expression objects (i.e. the result of re.compile()) or strings (match as an "include"-match). If a window matches all specified values, it is considered a match.

#### Parameters

# title:

Match against the WM\_NAME atom (X11) or title (Wayland).

#### wm\_class:

Match against the second string in WM\_CLASS atom (X11) or app ID (Wayland).

#### role:

Match against the WM\_ROLE atom (X11 only).

#### wm\_type:

Match against the WM\_TYPE atom (X11 only).

#### wm\_instance\_class:

Match against the first string in WM\_CLASS atom (X11) or app ID (Wayland).

#### net\_wm\_pid:

Match against the \_NET\_WM\_PID atom (X11) or PID (Wayland).

#### func:

Delegate the match to the given function, which receives the tested client as an argument and must return **True** if it matches, **False** otherwise.

#### wid:

Match against the window ID. This is a unique ID given to each window.

# Rule

How to act on a match.

A Rule contains a list of Match objects, and a specification about what to do when any of them is matched.

#### Parameters

match:

Match object or a list of such associated with this rule.

#### float:

Should we auto float this window?

intrusive:

Should we override the group's exclusive setting?

## break\_on\_match:

Should we stop applying rules if this rule is matched?

# ScratchPad and DropDown

ScratchPad is a special - by default invisible - group which acts as a container for DropDown configurations. A DropDown can be configured to spawn a defined process and bind thats process' window to it. The associated window can then be shown and hidden by the lazy command dropdown\_toggle() (see *Lazy objects*) from the ScratchPad group. Thus - for example - your favorite terminal emulator turns into a quake-like terminal by the control of Qtile.

If the DropDown window turns visible it is placed as a floating window on top of the current group. If the DropDown is hidden, it is simply switched back to the ScratchPad group.

# Example

```
from libgtile.config import Group, ScratchPad, DropDown, Key
from libgtile.lazy import lazy
groups = [
    ScratchPad("scratchpad", [
        # define a drop down terminal.
        # it is placed in the upper third of screen by default.
        DropDown("term", "urxvt", opacity=0.8),
        # define another terminal exclusively for ``qtile shell` at different position
        DropDown("qtile shell", "urxvt -hold -e 'qtile shell'",
                 x=0.05, y=0.4, width=0.9, height=0.6, opacity=0.9,
                 on_focus_lost_hide=True) ]),
   Group("a"),
]
keys = [
  # toggle visibiliy of above defined DropDown named "term"
  Key([], 'F11', lazy.group['scratchpad'].dropdown_toggle('term')),
```

```
Key([], 'F12', lazy.group['scratchpad'].dropdown_toggle('qtile shell')),
```

Note that if the window is set to not floating, it is detached from DropDown and ScratchPad, and a new process is spawned next time the DropDown is set visible.

Some programs run in a server-like mode where the spawned process does not directly own the window that is created, which is instead created by a background process. In this case, the window may not be correctly caught in the scratchpad group. To work around this, you can pass a Match object to the corresponding DropDown. See below.

# Reference

]

# ScratchPad

Represents a "ScratchPad" group

ScratchPad adds a (by default) invisible group to Qtile. That group is used as a place for currently not visible windows spawned by a DropDown configuration.

#### Parameters

#### name:

The name of this group.

# dropdowns:

DropDown s available on the scratchpad.

#### position:

The position of this group.

#### label:

The display name of the ScratchPad group. Defaults to the empty string such that the group is hidden in GroupBox widget.

#### single:

If True, only one of the dropdowns will be visible at a time.

# DropDown

## class libqtile.config.DropDown(name: str, cmd: str, \*\*config: Any)

Configure a specified command and its associated window for the ScratchPad. That window can be shown and hidden using a configurable keystroke or any other scripted trigger.

# **Configuration options**

key	default	description
height	0.35	Height of window as fraction of current screen.
match	None	Use a Match to identify the spawned window and move it to the scratchpad, instead of relying on the window's PID. This works around some programs that may not be caught by the window's PID if it does not match the PID of the spawned process.
on_focus_lost_hi	True	Shall the window be hidden if focus is lost? If so, the DropDown is hidden if window focus or the group is changed.
opacity	0.9	Opacity of window as fraction. One is opaque.
warp_pointer	True	Shall pointer warp to center of window on activation? This only has effect if any of the on_focus_lost_xxx options are True
width	0.8	Width of window as fraction of current screen width
x	0.1	X position of window as fraction of current screen width. 0 is the left most position.
у	0.0	Y position of window as fraction of current screen height. 0 is the top most position. To show the window at bottom, you have to configure a value < 1 and an appropriate height.

# 9.3.3 Keys

The keys variable defines Qtile's key bindings.

# **Default Key Bindings**

The mod key for the default config is mod4, which is typically bound to the "Super" keys, which are things like the windows key and the mac command key. The basic operation is:

- mod + k or mod + j: switch windows on the current stack
- mod + <space>: put focus on the other pane of the stack (when in stack layout)
- mod + <tab>: switch layouts
- mod + w: close window
- mod + <ctrl> + r: reload the config
- mod + <group name>: switch to that group
- mod + <shift> + <group name>: send a window to that group
- mod + <enter>: start terminal guessed by libqtile.utils.guess\_terminal
- mod + r: start a little prompt in the bar so users can run arbitrary commands

The default config defines one screen and 8 groups, one for each letter in asdfuiop. It has a basic bottom bar that includes a group box, the current window name, a little text reminder that you're using the default config, a system tray, and a clock.

The default configuration has several more advanced key combinations, but the above should be enough for basic usage of qtile.

See Keybindings in images for visual keybindings in keyboard layout.

# **Defining key bindings**

Individual key bindings are defined with Key as demonstrated in the following example. Note that you may specify more than one callback functions.

```
from libqtile.config import Key
keys = [
    # Pressing "Meta + Shift + a".
    Key(["mod4", "shift"], "a", callback, ...),
    # Pressing "Control + p".
    Key(["control"], "p", callback, ...),
    # Pressing "Meta + Tab".
    Key(["mod4", "mod1"], "Tab", callback, ...),
]
```

The above may also be written more concisely with the help of the EzKey helper class. The following example is functionally equivalent to the above:

```
from libqtile.config import EzKey as Key
keys = [
   Key("M-S-a", callback, ...),
   Key("C-p", callback, ...),
   Key("M-A-<Tab>", callback, ...),
]
```

The EzKey modifier keys (i.e. MASC) can be overwritten through the EzKey.modifier\_keys dictionary. The defaults are:

```
modifier_keys = {
    'M': 'mod4',
    'A': 'mod1',
    'S': 'shift',
    'C': 'control',
}
```

Callbacks can also be configured to work only under certain conditions by using the when() method. Currently, the following conditions are supported:

```
from libqtile.config import Key
keys = [
    # Only trigger callback for a specific layout
    Key(
        [mod, 'shift'],
        "j",
        lazy.layout.grow().when(layout='verticaltile'),
        lazy.layout.grow_down().when(layout='columns')
    ),
    # Limit action to when the current window is not floating (default True)
```

```
Key([mod], "f", lazy.window.toggle_fullscreen().when(when_floating=False))
# Also matches are supported on the current window
# For example to match on the wm_class for fullscreen do the following
Key([mod], "f", lazy.window.toggle_fullscreen().when(focused=Match(wm_class=
'yourclasshere"))
]
```

# **KeyChords**

Qtile also allows sequences of keys to trigger callbacks. These sequences are known as chords and are defined with KeyChord. Chords are added to the keys section of the config file.

```
from libqtile.config import Key, KeyChord
keys = [
    KeyChord([mod], "z", [
        Key([], "x", lazy.spawn("xterm"))
    ])
]
```

The above code will launch xterm when the user presses Mod + z, followed by x.

**Warning:** Users should note that key chords are aborted by pressing <escape>. In the above example, if the user presses Mod + z, any following key presses will still be sent to the currently focussed window. If <escape> has not been pressed, the next press of x will launch xterm.

## Modes

Chords can optionally persist until a user presses <escape>. This can be done by setting mode=True. This can be useful for configuring a subset of commands for a particular situations (i.e. similar to vim modes).

```
from libqtile.config import Key, KeyChord
keys = [
    KeyChord([mod], "z", [
        Key([], "g", lazy.layout.grow()),
        Key([], "s", lazy.layout.shrink()),
        Key([], "n", lazy.layout.normalize()),
        Key([], "m", lazy.layout.maximize())],
        mode=True,
        name="Windows"
    )
]
```

In the above example, pressing Mod + z triggers the "Windows" mode. Users can then resize windows by just pressing g (to grow the window), s to shrink it etc. as many times as needed. To exit the mode, press <escape>.

**Note:** The Chord widget (Chord) will display the name of the active chord (as set by the name parameter). This is particularly useful where the chord is a persistent mode as this will indicate when the chord's mode is still active.

# Chains

Chords can also be chained to make even longer sequences.

```
from libqtile.config import Key, KeyChord
keys = [
    KeyChord([mod], "z", [
        KeyChord([], "x", [
            Key([], "c", lazy.spawn("xterm"))
        ])
    ])
]
```

Modes can also be added to chains if required. The following example demonstrates the behaviour when using the mode argument in chains:

```
from libqtile.config import Key, KeyChord
keys = [
    KeyChord([mod], "z", [
        KeyChord([], "y", [
            KeyChord([], "x", [
                Key([], "c", lazy.spawn("xterm"))
                ], mode=True, name="inner")
            ])
    ], mode=True, name="outer")
]
```

After pressing Mod+z y x c, the "inner" mode will remain active. When pressing <escape>, the "inner" mode is exited. Since the mode in between does not have mode set, it is also left. Arriving at the "outer" mode (which has this argument set) stops the "leave" action and "outer" now becomes the active mode.

**Note:** If you want to bind a custom key to leave the current mode (e.g. Control + G in addition to <escape>), you can specify lazy.ungrab\_chord() as the key action. To leave all modes and return to the root bindings, use lazy.ungrab\_all\_chords().

# **Modifiers**

On most systems mod1 is the Alt key - you can see which modifiers, which are enclosed in a list, map to which keys on your system by running the xmodmap command. This example binds Alt-k to the "down" command on the current layout. This command is standard on all the included layouts, and switches to the next window (where "next" is defined differently in different layouts). The matching "up" command switches to the previous window.

Modifiers include: "shift", "lock", "control", "mod1", "mod2", "mod3", "mod4", and "mod5". They can be used in combination by appending more than one modifier to the list:

```
Key(
   ["mod1", "control"], "k",
   lazy.layout.shuffle_down()
)
```

# **Special keys**

These are most commonly used special keys. For complete list please see the code. You can create bindings on them just like for the regular keys. For example Key(["mod1"], "F4", lazy.window.kill()).

Return
BackSpace
Tab
space
Home, End
Left, Up, Right, Down
F1, F2, F3,
XF86AudioRaiseVolume
XF86AudioLowerVolume
XF86AudioMute
XF86AudioNext
XF86AudioPrev
XF86MonBrightnessUp
XF86MonBrightnessDown

Reference

Key

Defines a keybinding.

## Parameters

#### modifiers:

A list of modifier specifications. Modifier specifications are one of: "shift", "lock", "control", "mod1", "mod2", "mod3", "mod4", "mod5".

key:

A key specification, e.g. "a", "Tab", "Return", "space".

#### commands:

One or more LazyCall objects to evaluate in sequence upon keypress. Multiple commands should be separated by commas.

#### desc:

Description to be added to the key binding. (Optional)

#### swallow:

Configures when we swallow the key binding. (Optional) Setting it to False will forward the key binding to the focused window after the commands have been executed.

## KeyChord

Define a key chord aka Vim-like mode.

#### **Parameters**

#### modifiers:

A list of modifier specifications. Modifier specifications are one of: "shift", "lock", "control", "mod1", "mod2", "mod3", "mod4", "mod5".

#### key:

A key specification, e.g. "a", "Tab", "Return", "space".

#### submappings:

A list of Key or KeyChord declarations to bind in this chord.

#### mode:

Boolean. Setting to True will result in the chord persisting until Escape is pressed. Setting to False (default) will exit the chord once the sequence has ended.

#### name:

A string to name the chord. The name will be displayed in the Chord widget.

#### desc:

A string to describe the chord. This attribute is not directly used by Qtile but users may want to access this when creating scripts to show configured keybindings.

#### swallow:

Configures when we swallow the key binding of the chord. (Optional) Setting it to False will forward the key binding to the focused window after the commands have been executed.

#### **EzKey**

class libqtile.config.EzKey(keydef: str, \*commands: LazyCall, desc: str = ")

Defines a keybinding using the Emacs-like format.

#### **Parameters**

#### keydef:

The Emacs-like key specification, e.g. "M-S-a".

#### commands:

A list LazyCall objects to evaluate in sequence upon keypress.

desc:

Description to be added to the key binding. (Optional)

# 9.3.4 Layouts

A layout is an algorithm for laying out windows in a group on your screen. Since Qtile is a tiling window manager, this usually means that we try to use space as efficiently as possible, and give the user ample commands that can be bound to keys to interact with layouts.

The layouts variable defines the list of layouts you will use with Qtile. The first layout in the list is the default. If you define more than one layout, you will probably also want to define key bindings to let you switch to the next and previous layouts.

See Built-in Layouts for a listing of available layouts.

# Example

```
from libqtile import layout
layouts = [
    layout.Max(),
    layout.Stack(stacks=2)
]
```

# 9.3.5 Mouse

The mouse config file variable defines a set of global mouse actions, and is a list of Click and Drag objects, which define what to do when a window is clicked or dragged.

# **Default Mouse Bindings**

By default, holding your mod key and left-clicking (and holding) a window will allow you to drag it around as a floating window. Holding your mod key and right-clicking (and holding) a window will resize the window (and also make it float if it is not already floating).

# Example

```
from libqtile.config import Click, Drag
mouse = [
    Drag([mod], "Button1", lazy.window.set_position_floating(),
        start=lazy.window.get_position()),
    Drag([mod], "Button3", lazy.window.set_size_floating(),
        start=lazy.window.get_size()),
    Click([mod], "Button2", lazy.window.bring_to_front())
]
```

The above example can also be written more concisely with the help of the EzClick and EzDrag helpers:

```
from libqtile.config import EzClick as Click, EzDrag as Drag
mouse = [
    Drag("M-1", lazy.window.set_position_floating(),
        start=lazy.window.get_position()),
    Drag("M-3", lazy.window.set_size_floating(),
        start=lazy.window.get_size()),
    Click("M-2", lazy.window.bring_to_front())
]
```

# Reference

# Click

class libqtile.config.Click(modifiers: list[str], button: str, \*commands: LazyCall)

Bind commands to a clicking action.

#### Parameters

#### modifiers:

A list of modifier specifications. Modifier specifications are one of: "shift", "lock", "control", "mod1", "mod2", "mod3", "mod4", "mod5".

### button:

The button used to start dragging e.g. "Button1".

## commands:

A list LazyCall objects to evaluate in sequence upon drag.

# Drag

Bind commands to a dragging action.

On each motion event the bound commands are executed with two additional parameters specifying the x and y offset from the previous position.

#### Parameters

#### modifiers:

A list of modifier specifications. Modifier specifications are one of: "shift", "lock", "control", "mod1", "mod2", "mod3", "mod4", "mod5".

#### button:

The button used to start dragging e.g. "Button1".

# commands:

A list LazyCall objects to evaluate in sequence upon drag.

#### start:

A LazyCall object to be evaluated when dragging begins. (Optional)

#### warp\_pointer:

A bool indicating if the pointer should be warped to the bottom right of the window at the start of dragging. (Default: *False*)

# **EzClick**

class libqtile.config.EzClick(btndef: str, \*commands: LazyCall)

Bind commands to a clicking action using the Emacs-like format.

Parameters

btndef:

The Emacs-like button specification, e.g. "M-1".

commands:

A list LazyCall objects to evaluate in sequence upon drag.

# 9.3.6 Screens

The screens configuration variable is where the physical screens, their associated bars, and the widgets contained within the bars are defined (see *Built-in Widgets* for a listing of available widgets).

# Example

Tying together screens, bars and widgets, we get something like this:

```
from libqtile.config import Screen
from libqtile import bar, widget
window_name = widget.WindowName()
screens = [
    Screen(
        bottom=bar.Bar([
            widget.GroupBox(),
            window_name.
            ], 30),
        ),
    Screen(
        bottom=bar.Bar([
            widget.GroupBox(),
            window_name,
            ], 30),
        )
    ]
```

Note that a widget can be passed to multiple bars (and likewise multiple times to the same bar). Its contents is mirrored across all copies so this is useful where you want identical content (e.g. the name of the focussed window, like in this example).

Bars support both solid background colors and gradients by supplying a list of colors that make up a linear gradient. For example, bar.Bar(..., background="#000000") will give you a black back ground (the default), while bar. Bar(..., background=["#000000", "#FFFFFF"]) will give you a background that fades from black to white.

Bars (and widgets) also support transparency by adding an alpha value to the desired color. For example, bar.Bar(. .., background="#00000000") will result in a fully transparent bar. Widget contents will not be impacted i.e. this is different to the opacity parameter which sets the transparency of the entire window.

Note: In X11 backends, transparency will be disabled in a bar if the background color is fully opaque.

Users can add borders to the bar by using the border\_width and border\_color parameters. Providing a single value sets the value for all four sides while sides can be customised individually by setting four values in a list (top, right, bottom, left) e.g. border\_width=[2, 0, 2, 0] would draw a border 2 pixels thick on the top and bottom of the bar.

#### **Multiple Screens**

You will see from the example above that screens is a list of individual Screen objects. The order of the screens in this list should match the order of screens as seen by your display server.

# X11

You can view the current order of your screens by running xrandr --listmonitors.

Examples of how to set the order of your screens can be found on the Arch wiki.

#### Wayland

The Wayland backend supports the wlr-output-management protocol for configuration of outputs by tools such as Kanshi.

#### **Fake Screens**

instead of using the variable *screens* the variable *fake\_screens* can be used to set split a physical monitor into multiple screens. They can be used like this:

```
from libqtile.config import Screen
from libqtile import bar, widget
# screens look like this
#
     600
              300
#
  |----|
           480| |580
#
  1
           | B |
#
  / A
#
  |----|--| |
  1
#
        400/--/----/
  1 C
#
          | | 400
#
  |----| D
                   #
     500
          |----|
#
               400
#
# Notice there is a hole in the middle
# also D goes down below the others
fake_screens = [
 Screen(
     bottom=bar.Bar(
        Г
```

```
widget.Prompt(),
            widget.Sep(),
            widget.WindowName(),
            widget.Sep(),
            widget.Systray(),
            widget.Sep(),
            widget.Clock(format='%H:%M:%S %d.%m.%Y')
        ],
        24,
        background="#555555"
    ),
    x=≬,
    y=≬,
    width=600,
    height=480
).
Screen(
    top=bar.Bar(
        Ε
            widget.GroupBox(),
            widget.WindowName(),
            widget.Clock()
        ],
        30,
    ),
    x=600,
    y=0,
    width=300,
    height=580
),
Screen(
    top=bar.Bar(
        Ε
            widget.GroupBox(),
            widget.WindowName(),
            widget.Clock()
        ],
        30,
    ),
    x=0,
    y=480,
    width=500,
    height=400
),
Screen(
    top=bar.Bar(
        Ε
            widget.GroupBox(),
            widget.WindowName(),
            widget.Clock()
        ],
        30,
```

```
),
x=500,
y=580,
width=400,
height=400
),
]
```

# **Third-party bars**

There might be some reasons to use third-party bars. For instance you can come from another window manager and you have already configured dzen2, xmobar, or something else. They definitely can be used with Qtile too. In fact, any additional configurations aren't needed. Just run the bar and qtile will adapt.

## Reference

### Screen

### class libqtile.config.Screen(\*args, \*\*kwargs)

A physical screen, and its associated paraphernalia.

Define a screen with a given set of Bar's of a specific geometry. Also, x, y, width, and height aren't specified usually unless you are using 'fake screens'.

The wallpaper parameter, if given, should be a path to an image file. How this image is painted to the screen is specified by the wallpaper\_mode parameter. By default, the image will be placed at the screens origin and retain its own dimensions. If the mode is "fill", the image will be centred on the screen and resized to fill it. If the mode is "stretch", the image is stretched to fit all of it into the screen.

The x11\_drag\_polling\_rate parameter specifies the rate for drag events in the X11 backend. By default this is set to None, indicating no limit. Because in the X11 backend we already handle motion notify events later, the performance should already be okay. However, to limit these events further you can use this variable and e.g. set it to your monitor refresh rate. 60 would mean that we handle a drag event 60 times per second.

#### Available commands

Click to view the available commands for Screen

# Bar

class libqtile.bar.Bar(\*args, \*\*kwargs)

A bar, which can contain widgets

# Parameters

#### widgets

A list of widget objects.

#### size

The "thickness" of the bar, i.e. the height of a horizontal bar, or the width of a vertical bar.

key	default	description
background	'#000000'	Background colour.
border_color	'#000000'	Border colour as str or list of str [N E S W]
border_width	0	Width of border as int of list of ints [N E S W]
margin	0	Space around bar as int or list of ints [N E S W].
opacity	1	Bar window opacity.

# **Configuration options**

# Available commands

Click to view the available commands for Bar

# Gap

class libqtile.bar.Gap(size: int)

A gap placed along one of the edges of the screen

Qtile will avoid covering gaps with windows.

# Parameters

#### size

The "thickness" of the gap, i.e. the height of a horizontal gap, or the width of a vertical gap.

# 9.3.7 Hooks

Qtile provides a mechanism for subscribing to certain events in libqtile.hook. To subscribe to a hook in your configuration, simply decorate a function with the hook you wish to subscribe to.

See Built-in Hooks for a listing of available hooks.

# **Examples**

# Automatic floating dialogs

Let's say we wanted to automatically float all dialog windows (this code is not actually necessary; Qtile floats all dialogs by default). We would subscribe to the client\_new hook to tell us when a new window has opened and, if the type is "dialog", as can set the window to float. In our configuration file it would look something like this:

```
from libqtile import hook
@hook.subscribe.client_new
def floating_dialogs(window):
    dialog = window.window.get_wm_type() == 'dialog'
    transient = window.window.get_wm_transient_for()
    if dialog or transient:
        window.floating = True
```

A list of available hooks can be found in the Built-in Hooks reference.

# **Autostart**

If you want to run commands or spawn some applications when Qtile starts, you'll want to look at the startup and startup\_once hooks. startup is emitted every time Qtile starts (including restarts), whereas startup\_once is only emitted on the very first startup.

Let's create an executable file  $\sim$ /.config/qtile/autostart.sh that will start a few programs when Qtile first runs. Remember to *chmod* +*x* ~/.*config/qtile/autostart.sh* so that it can be executed.

```
#!/bin/sh
pidgin &
dropbox start &
```

We can then subscribe to startup\_once to run this script:

```
import os
import subprocess
from libqtile import hook
Chook.subscribe.startup_once
def autostart():
    home = os.path.expanduser('~/.config/qtile/autostart.sh')
    subprocess.Popen([home])
```

## Accessing the qtile object

If you want to do something with the Qtile manager instance inside a hook, it can be imported into your config:

```
from libqtile import qtile
```

## Async hooks

Hooks can also be defined as coroutine functions using async def, which will run them asynchronously in the event loop:

@hook.subscribe.focus\_change
async def \_():

In addition to the above variables, there are several other boolean configuration variables that control specific aspects of Qtile's behavior:

variable	default	description
auto_ful	True	If a window requests to be fullscreen, it is automatically fullscreened. Set this to false if you only want windows to be fullscreen if you ask them to be.
bring_fr	False	When clicked, should the window be brought to the front or not. If this is set to "float- ing_only", only floating windows will get affected (This sets the X Stack Mode to Above.). This will ignore the layering rules and will therefore bring windows above other windows, even if they have been set as "kept_above". This may cause issues with docks and other similar apps as these may end up hidden behind other windows. Setting this to False or "floating_only" may therefore be required when using these apps.
cursor_w	False	If true, the cursor follows the focus as directed by the keyboard, warping to the center of the focused window. When switching focus between screens, If there are no windows in the screen, the cursor will warp to the center of the screen.
dgroups_	None	A function which generates group binding hotkeys. It takes a single argument, the DGroups object, and can use that to set up dynamic key bindings. A sample implementation is available in libqtile/dgroups.py called simple_key_binder(), which will bind groups to mod+shift+0-10 by default.
dgroups_ extensic	same as	A list of Rule objects which can send windows to various groups based on matching criteria. Default settings for extensions.
floating		The default floating layout to use. This allows you to set custom floating rules among other things if you wish. See the configuration file for the default <i>float_rules</i> .
floats_k		Floating windows are kept above tiled windows (Currently x11 only. Wayland support com- ing soon.)
focus_on	'smart'	Behavior of the _NET_ACTIVATE_WINDOW message sent by applications <ul> <li>urgent: urgent flag is set for the window</li> </ul>
		• focus: automatically focus the window
		• smart: automatically focus if the window is in the current group
		• never: never automatically focus any window that requests it
follow_m	True	Controls whether or not focus follows the mouse around as it moves across windows in a layout.
widget_d	dict(fon	Default settings for bar widgets.
	fontsize	
	padding=	
reconfig		Controls whether or not to automatically reconfigure screens when there are changes in randr output configuration.
wmname	'LG3D'	Gasp! We're lying here. In fact, nobody really uses or cares about this string besides java UI toolkits; you can see several discussions on the mailing lists, GitHub issues, and other WM documentation that suggest setting this string if your java app doesn't work correctly. We may as well just lie and say that we're a working one by default. We choose LG3D to maximize irony: it is a 3D non-reparenting WM written in java that happens to be on java's whitelist.
auto_min	True	If things like steam games want to auto-minimize themselves when losing focus, should we respect this or not?

# 9.4 Testing your configuration

The best way to test changes to your configuration is with the provided scripts at ./scripts/xephyr (X11) or ./scripts/wephyr (Wayland). This will run Qtile with your config.py inside a nested window and prevent your running instance of Qtile from crashing if something goes wrong.

See *Hacking Qtile* for more information on using Xephyr.

## CHAPTER

# TEN

# **BUILT-IN LAYOUTS**

# 10.1 Bsp

class libqtile.layout.Bsp(\*args, \*\*kwargs)

This layout is inspired by bspwm, but it does not try to copy its features.

The first client occupies the entire screen space. When a new client is created, the selected space is partitioned in 2 and the new client occupies one of those subspaces, leaving the old client with the other.

The partition can be either horizontal or vertical according to the dimensions of the current space: if its width/height ratio is above a pre-configured value, the subspaces are created side-by-side, otherwise, they are created on top of each other. The partition direction can be freely toggled. All subspaces can be resized and clients can be shuffled around.

All clients are organized at the leaves of a full binary tree.

An example key configuration is:

```
Key([mod], "j", lazy.layout.down()),
Key([mod], "k", lazy.layout.up()),
Key([mod], "h", lazy.layout.left()),
Key([mod], "1", lazy.layout.right()),
Key([mod, "shift"], "j", lazy.layout.shuffle_down()),
Key([mod, "shift"], "k", lazy.layout.shuffle_up()),
Key([mod, "shift"], "h", lazy.layout.shuffle_left()),
Key([mod, "shift"], "1", lazy.layout.shuffle_right()),
Key([mod, "mod1"], "j", lazy.layout.flip_down()),
Key([mod, "mod1"], "k", lazy.layout.flip_up()),
Key([mod, "mod1"], "h", lazy.layout.flip_left()),
Key([mod, "mod1"], "l", lazy.layout.flip_right()),
Key([mod, "control"], "j", lazy.layout.grow_down()),
Key([mod, "control"], "k", lazy.layout.grow_up()),
Key([mod, "control"], "h", lazy.layout.grow_left()),
Key([mod, "control"], "1", lazy.layout.grow_right()),
Key([mod, "shift"], "n", lazy.layout.normalize()),
Key([mod], "Return", lazy.layout.toggle_split()),
```

key	default	description
border_focus	'#881111'	Border colour(s) for the focused window.
border_normal	'#220000'	Border colour(s) for un-focused windows.
border_on_single	False	Draw border when there is only one window.
border_width	2	Border width.
fair	True	New clients are inserted in the shortest branch.
grow_amount	10	Amount by which to grow a window/column.
lower_right	True	New client occupies lower or right subspace.
margin	0	Margin of the layout (int or list of ints [N E S W]).
<pre>margin_on_single</pre>	None	Margin when there is only one window (int or list of ints [N E S W], 'None' to use 'margin' value).
ratio	1.6	Width/height ratio that defines the partition direction.
wrap_clients	False	Whether client list should be wrapped when using next and previous commands.

Click to view the available commands for Bsp

# 10.2 Columns

class libqtile.layout.Columns(\*args, \*\*kwargs)

Extension of the Stack layout.

The screen is split into columns, which can be dynamically added or removed. Each column can present its windows in 2 modes: split or stacked. In split mode, all windows are presented simultaneously, spliting the column space. In stacked mode, only a single window is presented from the stack of windows. Columns and windows can be resized and windows can be shuffled around.

This layout can also emulate wmii's default layout via:

layout.Columns(num\_columns=1, insert\_position=1)

Or the "Vertical", and "Max", depending on the default parameters.

An example key configuration is:

```
Key([mod], "j", lazy.layout.down()),
Key([mod], "k", lazy.layout.up()),
Key([mod], "h", lazy.layout.left()),
Key([mod], "1", lazy.layout.right()),
Key([mod, "shift"], "j", lazy.layout.shuffle_down()),
Key([mod, "shift"], "k", lazy.layout.shuffle_up()),
Key([mod, "shift"], "h", lazy.layout.shuffle_left()),
Key([mod, "shift"], "l", lazy.layout.shuffle_right()),
Key([mod, "control"], "j", lazy.layout.grow_down()),
Key([mod, "control"], "k", lazy.layout.grow_up()),
Key([mod, "control"], "h", lazy.layout.grow_left()),
Key([mod, "control"], "1", lazy.layout.grow_right()),
Key([mod, "shift", "control"], "h", lazy.layout.swap_column_left()),
Key([mod, "shift", "control"], "1", lazy.layout.swap_column_right()),
Key([mod], "Return", lazy.layout.toggle_split()),
Key([mod], "n", lazy.layout.normalize()),
```

key	default	description
border_focus	'#881111'	Border colour(s) for the focused window.
border_focus_sta	'#881111'	Border colour(s) for the focused window in stacked columns.
border_normal	'#220000'	Border colour(s) for un-focused windows.
<pre>border_normal_st</pre>	'#220000'	Border colour(s) for un-focused windows in stacked columns.
border_on_single	False	Draw a border when there is one only window.
border_width	2	Border width.
fair	False	Add new windows to the column with least windows.
grow_amount	10	Amount by which to grow a window/column.
insert_position	0	Position relative to the current window where new ones are in- serted (0 means right above the current window, 1 means right after).
margin	0	Margin of the layout (int or list of ints [N E S W]).
<pre>margin_on_single</pre>	None	Margin when only one window. (int or list of ints [N E S W])
num_columns	2	Preferred number of columns.
<pre>single_border_wi</pre>	None	Border width for single window.
split	True	New columns presentation mode.
<pre>wrap_focus_colum</pre>	True	Wrap the screen when moving focus across columns.
<pre>wrap_focus_rows</pre>	True	Wrap the screen when moving focus across rows.
wrap_focus_stack	True	Wrap the screen when moving focus across stacked.

# **Configuration options**

## Available commands

Click to view the available commands for Columns

# 10.3 Floating

## class libqtile.layout.Floating(\*args, \*\*kwargs)

Floating layout, which does nothing with windows but handles focus order

### **Configuration options**

key	default	description
border_focus	'#0000ff'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_width	1	Border width.
fullscreen_borde	0	Border width for fullscreen.
<pre>max_border_width</pre>	0	Border width for maximize.

## Available commands

Click to view the available commands for *Floating* 

# 10.4 Matrix

## class libqtile.layout.Matrix(\*args, \*\*kwargs)

This layout divides the screen into a matrix of equally sized cells and places one window in each cell. The number of columns is configurable and can also be changed interactively.

## **Configuration options**

key	default	description
border_focus	'#0000ff'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_width	1	Border width.
columns	2	Number of columns
margin	0	Margin of the layout (int or list of ints [N E S W])

### Available commands

Click to view the available commands for Matrix

# 10.5 Max

## class libqtile.layout.Max(\*args, \*\*kwargs)

## Maximized layout

A simple layout that only displays one window at a time, filling the screen\_rect. This is suitable for use on laptops and other devices with small screens. Conceptually, the windows are managed as a stack, with commands to switch to next and previous windows in the stack.

### **Configuration options**

key	default	description
border_focus	'#0000ff'	Border colour(s) for the window when focused
border_normal	'#000000'	Border colour(s) for the window when not focused
border_width	0	Border width.
margin	0	Margin of the layout (int or list of ints [N E S W])
only_focused	True	Only draw the focused window

#### Available commands

Click to view the available commands for Max

# 10.6 MonadTall

# class libqtile.layout.MonadTall(\*args, \*\*kwargs)

Emulate the behavior of XMonad's default tiling scheme.

### Main-Pane:

A main pane that contains a single window takes up a vertical portion of the screen\_rect based on the ratio setting. This ratio can be adjusted with the grow\_main and shrink\_main or, while the main pane is in focus, grow and shrink. You may also set the ratio directly with set\_ratio.

1		
1		
1		
1		
1		

Using the flip method will switch which horizontal side the main pane will occupy. The main pane is considered the "top" of the stack.

Secondary-panes:

Occupying the rest of the screen\_rect are one or more secondary panes. The secondary panes will share the vertical space of the screen\_rect however they can be resized at will with the grow and shrink methods. The other secondary panes will adjust their sizes to smoothly fill all of the space.

1					
1					

Panes can be moved with the shuffle\_up and shuffle\_down methods. As mentioned the main pane is considered the top of the stack; moving up is counter-clockwise and moving down is clockwise.

The opposite is true if the layout is "flipped".

	(continued from previous page)
3	
1	
4	

Normalizing/Resetting:

To restore all secondary client windows to their default size ratios use the normalize method.

To reset all client windows to their default sizes, including the primary window, use the reset method.

Maximizing:

To toggle a client window between its minimum and maximum sizes simply use the maximize on a focused client.

Suggested Bindings:

```
Key([modkey], "h", lazy.layout.left()),
Key([modkey], "l", lazy.layout.right()),
Key([modkey], "j", lazy.layout.down()),
Key([modkey], "k", lazy.layout.up()),
Key([modkey, "shift"], "h", lazy.layout.swap_left()),
Key([modkey, "shift"], "l", lazy.layout.swap_right()),
Key([modkey, "shift"], "j", lazy.layout.shuffle_down()),
Key([modkey, "shift"], "k", lazy.layout.shuffle_up()),
Key([modkey], "i", lazy.layout.grow()),
Key([modkey], "m", lazy.layout.shrink()),
Key([modkey], "n", lazy.layout.normalize()),
Key([modkey], "o", lazy.layout.maximize()),
Key([modkey, "shift"], "space", lazy.layout.flip()),
```

**Configuration options** 

. .

key	default	description
align	0	Which side master plane will be placed (one of MonadTallleft or MonadTallright)
border_focus	'#ff0000'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_width	2	Border width.
change_ratio	0.05	Resize ratio
change_size	20	Resize change in pixels
margin	0	Margin of the layout
max_ratio	0.75	The percent of the screen-space the master pane should occupy at maximum.
min_ratio	0.25	The percent of the screen-space the master pane should occupy at minimum.
<pre>min_secondary_si</pre>	85	minimum size in pixel for a secondary pane window
new_client_posit	'after_current'	Place new windows: after_current - after the active window. be- fore_current - before the active window, top - at the top of the stack, bottom - at the bottom of the stack,
ratio	0.5	The percent of the screen-space the master pane should occupy by default.
<pre>single_border_wi</pre>	None	Border width for single window
single_margin	None	Margin size for single window

Click to view the available commands for MonadTall

# 10.7 MonadThreeCol

#### class libqtile.layout.MonadThreeCol(\*args, \*\*kwargs)

Emulate the behavior of XMonad's ThreeColumns layout.

A layout similar to tall but with three columns. With an ultra wide display this layout can be used for a huge main window - ideally at the center of the screen - and up to six reasonable sized secondary windows.

Main-Pane:

A main pane that contains a single window takes up a vertical portion of the screen\_rect based on the ratio setting. This ratio can be adjusted with the grow\_main and shrink\_main or, while the main pane is in focus, grow and shrink. The main pane can also be centered.

					1	
1						

Secondary-panes:

Occupying the rest of the screen\_rect are one or more secondary panes. The secondary panes will be divided into two columns and share the vertical space of each column. However they can be resized at will with the grow

		1			

and shrink methods. The other secondary panes will adjust their sizes to smoothly fill all of the space.

Panes can be moved with the shuffle\_up and shuffle\_down methods. As mentioned the main pane is considered the top of the stack; moving up is counter-clockwise and moving down is clockwise. A secondary pane can also be promoted to the main pane with the swap\_main method.

#### Normalizing/Resetting:

To restore all secondary client windows to their default size ratios use the normalize method.

To reset all client windows to their default sizes, including the primary window, use the reset method.

#### Maximizing:

To maximized a client window simply use the maximize on a focused client.

#### **Configuration options**

key	default	description
align	0	Which side master plane will be placed (one of MonadTallleft or MonadTallright)
border_focus	'#ff0000'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_width	2	Border width.
change_ratio	0.05	Resize ratio
change_size	20	Resize change in pixels
<pre>main_centered</pre>	True	Place the main pane at the center of the screen
margin	0	Margin of the layout
max_ratio	0.75	The percent of the screen-space the master pane should occupy at maximum.
min_ratio	0.25	The percent of the screen-space the master pane should occupy at minimum.
<pre>min_secondary_si</pre>	85	minimum size in pixel for a secondary pane window
new_client_posit	'top'	Place new windows: after_current - after the active window. be- fore_current - before the active window, top - at the top of the stack, bottom - at the bottom of the stack,
ratio	0.5	The percent of the screen-space the master pane should occupy by default.
<pre>single_border_wi</pre>	None	Border width for single window
single_margin	None	Margin size for single window

#### Available commands

Click to view the available commands for MonadThreeCol

# 10.8 MonadWide

### class libqtile.layout.MonadWide(\*args, \*\*kwargs)

Emulate the behavior of XMonad's horizontal tiling scheme.

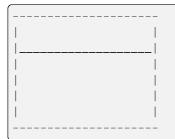

This layout attempts to emulate the behavior of XMonad wide tiling scheme.

Main-Pane:

A main pane that contains a single window takes up a horizontal portion of the screen\_rect based on the ratio setting. This ratio can be adjusted with the grow\_main and shrink\_main or, while the main pane is in focus, grow and shrink.

Using the flip method will switch which vertical side the main pane will occupy. The main pane is considered the "top" of the stack.

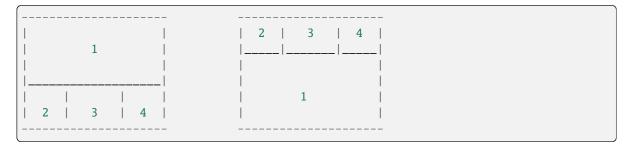

Secondary-panes:

Occupying the rest of the screen\_rect are one or more secondary panes. The secondary panes will share the horizontal space of the screen\_rect however they can be resized at will with the grow and shrink methods. The other secondary panes will adjust their sizes to smoothly fill all of the space.

-		 		
-		 		

Panes can be moved with the shuffle\_up and shuffle\_down methods. As mentioned the main pane is considered the top of the stack; moving up is counter-clockwise and moving down is clockwise.

The opposite is true if the layout is "flipped".

Normalizing/Resetting:

To restore all secondary client windows to their default size ratios use the normalize method.

To reset all client windows to their default sizes, including the primary window, use the reset method.

Maximizing:

To toggle a client window between its minimum and maximum sizes simply use the maximize on a focused client.

Suggested Bindings:

```
Key([modkey], "h", lazy.layout.left()),
Key([modkey], "l", lazy.layout.right()),
Key([modkey], "j", lazy.layout.down()),
Key([modkey], "k", lazy.layout.up()),
Key([modkey, "shift"], "h", lazy.layout.swap_left()),
Key([modkey, "shift"], "l", lazy.layout.swap_right()),
Key([modkey, "shift"], "j", lazy.layout.shuffle_down()),
Key([modkey, "shift"], "k", lazy.layout.shuffle_up()),
Key([modkey], "i", lazy.layout.grow()),
Key([modkey], "m", lazy.layout.shrink()),
Key([modkey], "n", lazy.layout.normalize()),
Key([modkey], "o", lazy.layout.maximize()),
Key([modkey, "shift"], "space", lazy.layout.flip()),
```

key	default	description
align	0	Which side master plane will be placed (one of MonadTallleft or MonadTallright)
border_focus	'#ff0000'	Border colour(s) for the focused window.
<pre>border_normal</pre>	'#000000'	Border colour(s) for un-focused windows.
border_width	2	Border width.
change_ratio	0.05	Resize ratio
change_size	20	Resize change in pixels
margin	0	Margin of the layout
max_ratio	0.75	The percent of the screen-space the master pane should occupy at maximum.
min_ratio	0.25	The percent of the screen-space the master pane should occupy at minimum.
<pre>min_secondary_si</pre>	85	minimum size in pixel for a secondary pane window
new_client_posit	'after_current'	Place new windows: after_current - after the active window. be- fore_current - before the active window, top - at the top of the stack, bottom - at the bottom of the stack,
ratio	0.5	The percent of the screen-space the master pane should occupy by default.
<pre>single_border_wi</pre>	None	Border width for single window
single_margin	None	Margin size for single window

Click to view the available commands for MonadWide

# 10.9 RatioTile

# class libqtile.layout.RatioTile(\*args, \*\*kwargs)

Tries to tile all windows in the width/height ratio passed in

# **Configuration options**

key	default	description
border_focus	'#0000ff'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_width	1	Border width.
fancy	False	Use a different method to calculate window sizes.
margin	0	Margin of the layout (int or list of ints [N E S W])
ratio	1.618	Ratio of the tiles
ratio_increment	0.1	Amount to increment per ratio increment

#### Available commands

Click to view the available commands for RatioTile

# 10.10 Slice

#### class libqtile.layout.Slice(\*args, \*\*kwargs)

Slice layout

This layout cuts piece of screen\_rect and places a single window on that piece, and delegates other window placement to other layout

#### **Configuration options**

key	default	description
fallback	<libqtile. layout.max. Max object at 0x7ff4651609a0&gt;</libqtile. 	Layout to be used for the non-slice area.
match	None	Match-object describing which window(s) to move to the slice.
side	'left'	Position of the slice (left, right, top, bottom).
width	256	Slice width.

#### Available commands

Click to view the available commands for Slice

# 10.11 Spiral

#### class libqtile.layout.Spiral(\*args, \*\*kwargs)

A mathematical layout.

Renders windows in a spiral form by splitting the screen based on a selected ratio. The direction of the split is changed every time in a defined order resulting in a spiral formation.

The main window can be sized with lazy.layout.grow\_main() and lazy.layout.shrink\_main(). All other windows are sized by lazy.layout.increase\_ratio() and lazy.layout.decrease\_ratio().

NB if main\_pane\_ratio is not set then it will also be adjusted according to ratio. However, as soon shrink\_main() or grow\_main() have been called once then the master pane will only change size following further calls to those methods.

Users are able to choose the location of the main (i.e. largest) pane and the direction of the rotation.

Some examples:

#### main\_pane="left", clockwise=True

```
main_pane="top", clockwise=False
```

```
| 1 |
| | | |
|---|---|---|
| 2 | 5 | 4 |
| ------|
| 3 |
```

### **Configuration options**

key	default	description	
border_focus	'#0000ff'	Border colour(s) for the focused window.	
border_normal	'#000000'	Border colour(s) for un-focused windows.	
border_width	1	Border width.	
clockwise	True	Direction of spiral	
main_pane	'left'	Location of biggest window 'top', 'bottom', 'left', 'right'	
main_pane_ratio	None	Ratio for biggest window or 'None' to use same ratio for all win- dows.	
margin	0	Margin of the layout (int or list of ints [N E S W])	
new_client_posit	'top'	Place new windows: 'after_current' - after the active window, 'before_current' - before the active window, 'top' - in the main pane, 'bottom '- at the bottom of the stack. NB windows that are added too low in the stack may be hidden if there is no remaining space in the spiral.	
ratio	0. 6180469715698392	Ratio of the tiles	
ratio_increment	0.1	Amount to increment per ratio increment	

## Available commands

Click to view the available commands for Spiral

# 10.12 Stack

#### class libqtile.layout.Stack(\*args, \*\*kwargs)

A layout composed of stacks of windows

The stack layout divides the screen\_rect horizontally into a set of stacks. Commands allow you to switch between stacks, to next and previous windows within a stack, and to split a stack to show all windows in the stack, or unsplit it to show only the current window.

Unlike the columns layout the number of stacks is fixed.

key	default	description
autosplit	False	Auto split all new stacks.
border_focus	'#0000ff'	Border colour(s) for the focused window.
border_focus_sta	None	Border colour(s) for the focused stacked window. If 'None' will default to border_focus.
border_normal	'#000000'	Border colour(s) for un-focused windows.
<pre>border_normal_st</pre>	None	Border colour(s) for un-focused stacked windows. If 'None' will default to border_normal.
border_width	1	Border width.
fair	False	Add new windows to the stacks in a round robin way.
margin	0	Margin of the layout (int or list of ints [N E S W])
num_stacks	2	Number of stacks.

Click to view the available commands for *Stack* 

# 10.13 Tile

## class libqtile.layout.Tile(\*args, \*\*kwargs)

A layout with two stacks of windows dividing the screen

The Tile layout divides the screen\_rect horizontally into two stacks. The maximum amount of "master" windows can be configured; surplus windows will be displayed in the slave stack on the right. Within their stacks, the windows will be tiled vertically. The windows can be rotated in their entirety by calling up() or down() or, if shift\_windows is set to True, individually.

key	default	description
add_after_last	False	Add new clients after all the others. If this is True, it overrides add_on_top.
add_on_top	True	Add new clients before all the others, potentially pushing other windows into slave stack.
border_focus	'#0000ff'	Border colour(s) for the focused window.
border_normal	'#000000'	Border colour(s) for un-focused windows.
border_on_single	True	Whether to draw border if there is only one window.
border_width	1	Border width.
expand	True	Expand the master windows to the full screen width if no slaves are present.
margin	0	Margin of the layout (int or list of ints [N E S W])
<pre>margin_on_single</pre>	True	Whether to draw margin if there is only one window.
master_length	1	Amount of windows displayed in the master stack. Surplus win- dows will be moved to the slave stack.
master_match	None	A Match object defining which window(s) should be kept masters (single or a list of Match-objects).
max_ratio	0.85	Maximum width of master windows
min_ratio	0.15	Minimum width of master windows
ratio	0.618	Width-percentage of screen size reserved for master windows.
ratio_increment	0.05	By which amount to change ratio when decrease_ratio or in- crease_ratio are called.
<pre>shift_windows</pre>	False	Allow to shift windows within the layout. If False, the layout will be rotated instead.

Click to view the available commands for Tile

# 10.14 TreeTab

#### class libqtile.layout.TreeTab(\*args, \*\*kwargs)

Tree Tab Layout

This layout works just like Max but displays tree of the windows at the left border of the screen\_rect, which allows you to overview all opened windows. It's designed to work with uzbl-browser but works with other windows too.

The panel at the left border contains sections, each of which contains windows. Initially the panel looks like flat lists inside its section, and looks like trees if some of the windows are "moved" left or right.

For example, it looks like below with two sections initially:

```
+----+
| Window A |
+----+
| Window B |
+----+
| Window C |
```

(continues on next page)

(continued from previous page)

```
+----+
|Section Bar |
+----+
```

And then it will look like below if "Window B" is moved right and "Window C" is moved right too:

++				
Section Foo				
++				
Window A				
++				
Window B				
++				
Window C				
++				
Section Bar				
++				

# **Configuration options**

key	default	description
active_bg	'000080'	Background color of active tab
active_fg	'ffffff'	Foreground color of active tab
bg_color	'000000'	Background color of tabs
border_width	2	Width of the border
font	'sans'	Font
fontshadow	None	font shadow color, default is None (no shadow)
fontsize	14	Font pixel size.
inactive_bg	'606060'	Background color of inactive tab
inactive_fg	'ffffff'	Foreground color of inactive tab
level_shift	8	Shift for children tabs
margin_left	6	Left margin of tab panel
margin_y	6	Vertical margin of tab panel
padding_left	6	Left padding for tabs
padding_x	6	Left padding for tab label
padding_y	2	Top padding for tab label
panel_width	150	Width of the left panel
place_right	False	Place the tab panel on the right side
previous_on_rm	False	Focus previous window on close instead of first.
section_bottom	6	Bottom margin of section
section_fg	'ffffff'	Color of section label
section_fontsize	11	Font pixel size of section label
section_left	4	Left margin of section label
section_padding	4	Bottom of margin section label
section_top	4	Top margin of section label
sections	['Default']	Titles of section instances
urgent_bg	'ff0000'	Background color of urgent tab
urgent_fg	'ffffff'	Foreground color of urgent tab
vspace	2	Space between tabs

## Available commands

Click to view the available commands for TreeTab

# 10.15 VerticalTile

#### class libqtile.layout.VerticalTile(\*args, \*\*kwargs)

Tiling layout that works nice on vertically mounted monitors

The available height gets divided by the number of panes, if no pane is maximized. If one pane has been maximized, the available height gets split in master- and secondary area. The maximized pane (master pane) gets the full height of the master area and the other panes (secondary panes) share the remaining space. The master area (at default 75%) can grow and shrink via keybindings.

			1	
1	< Panes			
2	<+	1	1	laster Area
3	<+			
		2		
4	<+		5	Secondary Area
		3		

Normal behavior. No One maximized pane in the master area maximized pane. No and two secondary panes in the specific areas. secondary area.

	In some cases VerticalTile can be
	useful on horizontal mounted
1	monitors two.
I	For example <b>if</b> you want to have a
	webbrowser and a shell below it.
I	
2	

Suggested keybindings:

```
Key([modkey], 'j', lazy.layout.down()),
Key([modkey], 'k', lazy.layout.up()),
Key([modkey], 'Tab', lazy.layout.next()),
Key([modkey, 'shift'], 'Tab', lazy.layout.next()),
Key([modkey, 'shift'], 'j', lazy.layout.shuffle_down()),
Key([modkey, 'shift'], 'k', lazy.layout.shuffle_up()),
Key([modkey], 'm', lazy.layout.maximize()),
Key([modkey], 'n', lazy.layout.normalize()),
```

# **Configuration options**

key	default	description
border_focus	'#FF0000'	Border color(s) for the focused window.
<pre>border_normal</pre>	'#FFFFFF'	Border color(s) for un-focused windows.
border_width	1	Border width.
margin	0	Border margin (int or list of ints [N E S W]).
<pre>single_border_wi</pre>	None	Border width for single window.
single_margin	None	Margin for single window.

# Available commands

# CHAPTER

# **ELEVEN**

# **BUILT-IN WIDGETS**

# 11.1 AGroupBox

class libqtile.widget.AGroupBox(\*args, \*\*kwargs)
 A widget that graphically displays the current group
 Supported bar orientations: horizontal only
 Configuration options

key	default	description
background	None	Widget background color
border	'000000'	group box border color
borderwidth	3	Current group border width
center_aligned	True	center-aligned group box
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
margin	3	Margin inside the box
margin_x	None	X Margin. Overrides 'margin' if set
margin_y	None	Y Margin. Overrides 'margin' if set
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
padding_x	None	X Padding. Overrides 'padding' if set
padding_y	None	Y Padding. Overrides 'padding' if set
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step

Click to view the available commands for AGroupBox

# 11.2 Backlight

# class libqtile.widget.Backlight(\*args, \*\*kwargs)

A simple widget to show the current brightness of a monitor.

If the change\_command parameter is set to None, the widget will attempt to use the interface at /sys/class to change brightness. Depending on the setup, the user may need to be added to the video group to have permission to write to this interface. This depends on having the correct udev rules the brightness file; these are typically installed alongside brightness tools such as brightnessctl (which changes the group to 'video') so installing that is an easy way to get it working.

You can also bind keyboard shortcuts to the backlight widget with:

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
backlight_name	'acpi_video0'	ACPI name of a backlight device
brightness_file	'brightness'	Name of file with the current brightness in /sys/class/backlight/backlight_name
change_command	'xbacklight -set {0}'	Execute command to change value
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{percent:2. 0%}'	Display format
markup	True	Whether or not to use pango markup
<pre>max_brightness_f</pre>	'max_brightness'	Name of file with the maximum brightness in /sys/class/backlight/backlight_name
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
step	10	Percent of backlight every scroll changed
update_interval	0.2	The delay in seconds between updates

Click to view the available commands for *Backlight* 

# 11.3 Battery

# class libqtile.widget.Battery(\*args, \*\*kwargs)

A text-based battery monitoring widget currently supporting FreeBSD

Supported bar orientations: horizontal and vertical

## **Configuration options**

key	default	description
background	None	Widget background color
battery	0	Which battery should be monitored (battery number or name)
charge_char	' A '	Character to indicate the battery is charging
discharge_char	'V'	Character to indicate the battery is discharging
empty_char	'x'	Character to indicate the battery is empty
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{char} {percent:2.0%} {hour:d}:{min:02 {watt:.2f} W'	Display format
full_char	'='	Character to indicate the battery is full
hide_threshold	None	Hide the text when there is enough energy $0 \le x \le 1$
low_background	None	Background color on low battery
low_foreground	'FF0000'	Font color on low battery
low_percentage	0.1	Indicates when to use the low_foreground color $0 < x < 1$
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
notification_tim	10	Time in seconds to display notification. 0 for no expiry.
notify_below	None	Send a notification below this battery level.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step

continues on next page

key	default	description
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
<pre>show_short_text</pre>	True	Show "Full" or "Empty" rather than formated text
unknown_char	'?'	Character to indicate the battery status is unknown
update_interval	60	Seconds between status updates

Table 1 – continued from previous page

Click to view the available commands for *Battery* 

# 11.4 Batterylcon

## class libqtile.widget.BatteryIcon(\*args, \*\*kwargs)

Battery life indicator widget.

Supported bar orientations: horizontal only

## **Configuration options**

key	default	description
background	None	Widget background color
battery	0	Which battery should be monitored
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
scale	1	Scale factor relative to the bar height. Defaults to 1
theme_path	<pre>'/home/docs/ checkouts/ readthedocs. org/ user_builds/ qtile/ checkouts/v0. 23.0/libqtile/ resources/ battery-icons'</pre>	Path of the icons
update_interval	60	Seconds between status updates

Click to view the available commands for *BatteryIcon* 

# 11.5 Bluetooth

# class libqtile.widget.Bluetooth(\*args, \*\*kwargs)

Displays bluetooth status for a particular connected device.

(For example your bluetooth headphones.)

Uses dbus-next to communicate with the system bus.

Widget requirements: dbus-next.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
hci	'/ dev_XX_XX_XX_XX_	hci0 device path, can be found with d-feet or similar dbus explorer.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step

### Available commands

# 11.6 CPU

# class libqtile.widget.CPU(\*args, \*\*kwargs)

A simple widget to display CPU load and frequency.

Widget requirements: psutil.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'CPU {freq_current}GH {load_percent}%'	CPU display format
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1.0	Update interval for the CPU widget

#### Available commands

Click to view the available commands for CPU

# 11.7 CPUGraph

# class libqtile.widget.CPUGraph(\*args, \*\*kwargs)

Display CPU usage graph.

Widget requirements: psutil.

Supported bar orientations: horizontal only

## **Configuration options**

key	default	description
background	None	Widget background color
border_color	'215578'	Widget border color
border_width	2	Widget border width
core	'all'	Which core to show (all/0/1/2/)
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
samples	100	Count of graph samples.
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

### Available commands

Click to view the available commands for CPUGraph

# 11.8 Canto

class libqtile.widget.Canto(\*args, \*\*kwargs)

Display RSS feeds updates using the canto console reader

Widget requirements: canto

Supported bar orientations: horizontal and vertical

key	default	description
all_format	'{number}'	All feeds display format
background	None	Widget background color
feeds	[]	List of feeds to display, empty for all
fetch	False	Whether to fetch new items on update
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
one_format	'{name}: {number}'	One feed display format
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.

Click to view the available commands for Canto

# 11.9 CapsNumLockIndicator

# class libqtile.widget.CapsNumLockIndicator(\*args, \*\*kwargs)

Really simple widget to show the current Caps/Num Lock state.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	0.5	Update Time in seconds.

Click to view the available commands for CapsNumLockIndicator

# 11.10 CheckUpdates

## class libqtile.widget.CheckUpdates(\*args, \*\*kwargs)

Shows number of pending updates in different unix systems.

The following built-in options are available via the distro parameter:

- 'Arch' runs ('pacman -Qu', 0)
- 'Arch\_checkupdates' runs ('checkupdates', 0)
- 'Arch\_Sup' runs ('pacman -Sup', 0)
- 'Arch\_paru' runs ('paru -Qu', 0)
- 'Arch\_paru\_Sup' runs ('paru -Sup', 0)
- 'Arch\_yay' runs ('yay -Qu', 0)

- 'Debian' runs ('apt-show-versions -u -b', 0)
- 'Gentoo\_eix' runs ('EIX\_LIMIT=0 eix -u# --world', 0)
- 'Guix' runs ('guix upgrade --dry-run', 0)
- 'Ubuntu' runs ('aptitude search ~U', 0)
- 'Fedora' runs ('dnf list updates -q', 1)
- 'FreeBSD' runs ("pkg\_version -I -l '<'", 0)
- 'Mandriva' runs ('urpmq --auto-select', 0)
- 'Void' runs ('xbps-install -nuMS', 0)

**Note:** It is common for package managers to return a non-zero code when there are no updates. As a result, the widget will treat *any* error as if there are no updates. If you are using a custom command/script, you should therefore ensure that it returns zero when it completes if you wish to see the output of your command.

In addition, as no errors are recorded to the log, if the widget is showing no updates and you believe that to be incorrect, you should run the appropriate command in a terminal to view any error messages.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
colour_have_upda	'ffffff'	Colour when there are updates.
colour_no_update	'ffffff'	Colour when there's no updates.
custom_command	None	Custom shell command for checking updates (counts the lines of
		the output)
custom_command_m	<function CheckUpdates. <lambda> at 0x7ff4641d6dd0&gt;</lambda></function 	Lambda function to modify line count from custom_command
display_format	'Updates: {updates}'	Display format if updates available
distro	'Arch'	Name of your distribution
execute	None	Command to execute on click
fmt	'{}'	To format the string returned by the widget. For example, if the
		clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
initial_text		Draw the widget immediately with an initial text, useful if it takes time to check system updates.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
no_update_string	11	String to display if no updates available
padding	None	Padding. Calculated if None.
restart_indicato		Indicator to represent reboot is required. (Ubuntu only)
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	60	Update interval in seconds.

# 11.11 Chord

# class libqtile.widget.Chord(\*args, \*\*kwargs)

Display current key chord

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
chords_colors	{}	colors per chord in form of tuple {'chord_name': ('bg', 'fg')}. Where a chord name is not in the dictionary, the default background and foreground values will be used.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
name_transform	<function Chord. <lambda> at 0x7ff4641d7130&gt;</lambda></function 	preprocessor for chord name it is pure function string -> string
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step

# 11.12 Clipboard

# class libqtile.widget.Clipboard(\*args, \*\*kwargs)

Display current clipboard contents

Supported bar orientations: horizontal and vertical

### **Configuration options**

key	default	description
background	None	Widget background color
blacklist	['keepassx']	list with blacklisted wm_class, sadly not every clipboard window sets them, keepassx does.Clipboard contents from blacklisted wm_classes will be replaced by the value of blacklist_text.
<pre>blacklist_text</pre>	*******	text to display when the wm_class is blacklisted
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>max_width</pre>	10	maximum number of characters to display (None for all, useful when width is bar.STRETCH)
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
selection	'CLIPBOARD'	the selection to display(CLIPBOARD or PRIMARY)
timeout	10	Default timeout (seconds) for display text, None to keep forever

# 11.13 Clock

# class libqtile.widget.Clock(\*args, \*\*kwargs)

A simple but flexible text-based clock

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'%H:%M'	A Python datetime format string
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
timezone	None	The timezone to use for this clock, either as string if pytz or dateutil is installed (e.g. "US/Central" or anything in /usr/share/zoneinfo), or as tzinfo (e.g. datetime.timezone.utc). None means the system local timezone and is the default.
update_interval	1.0	Update interval for the clock

# Available commands

Click to view the available commands for *Clock* 

# 11.14 Cmus

# class libqtile.widget.Cmus(\*args, \*\*kwargs)

A simple Cmus widget.

Show the metadata of now listening song and allow basic mouse control from the bar:

- toggle pause (or play if stopped) on left click;
- skip forward in playlist on scroll up;
- skip backward in playlist on scroll down.

Cmus (https://cmus.github.io) should be installed.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{play_icon}{art - {title}'	Format of playback info.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
noplay_color	'cecece'	Text colour when not playing.
padding	None	Padding. Calculated if None.
play_color	'00ff00'	Text colour when playing.
play_icon	1 1	Icon to display, if chosen.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	0.5	Update Time in seconds.

# 11.15 Countdown

## class libqtile.widget.Countdown(\*args, \*\*kwargs)

A simple countdown timer text widget

Supported bar orientations: horizontal and vertical

## **Configuration options**

key	default	description
background	None	Widget background color
date	datetime. datetime(2023, 9, 24, 22, 7, 45, 431481)	The datetime for the end of the countdown
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{D}d {H}h {M}m {S}s'	Format of the displayed text. Available variables:{D} == days, {H} == hours, {M} == minutes, {S} seconds.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1.0	Update interval in seconds for the clock

# 11.16 CryptoTicker

#### class libqtile.widget.CryptoTicker(\*args, \*\*kwargs)

A cryptocurrency ticker widget, data provided by the coinbase.com or the binance.com API. Defaults to displaying currency in whatever the current locale is. Examples:

# display the average price of bitcoin in local currency widget.CryptoTicker()

# display it in Euros: widget.CryptoTicker(currency="EUR")

# or a different cryptocurrency! widget.CryptoTicker(crypto="ETH")

# change the currency symbol: widget.CryptoTicker(currency="EUR", symbol="€")

# display from Binance API widget.CryptoTicker(api="binance", currency="USDT")

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
api	'coinbase'	API that provides the data.
background	None	Widget background color
crypto	'BTC'	The cryptocurrency to display.
currency		The baseline currency that the value of the crypto is displayed in.
data	None	Post Data
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	<pre>'{crypto}: {symbol}{amount: 2f}'</pre>	Display string formatting.
headers	{}	Extra Headers
json	True	Is Json?
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)

continues on next page

key	default	description
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
symbol	11	The symbol for the baseline currency.
update_interval	600	Update interval in seconds, if none, the widget updates only once.
url	None	Url
user_agent	'Qtile'	Set the user agent
xml	False	Is XML?

Table 2 – continued from previous page	ge

# 11.17 CurrentLayout

#### class libqtile.widget.CurrentLayout(\*args, \*\*kwargs)

Display the name of the current layout of the current group of the screen, the bar containing the widget, is on.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step

Click to view the available commands for CurrentLayout

# 11.18 CurrentLayoutIcon

#### class libqtile.widget.CurrentLayoutIcon(\*args, \*\*kwargs)

Display the icon representing the current layout of the current group of the screen on which the bar containing the widget is.

If you are using custom layouts, a default icon with question mark will be displayed for them. If you want to use custom icon for your own layout, for example, *FooGrid*, then create a file named "layout-foogrid.png" and place it in ~*l.icons* directory. You can as well use other directories, but then you need to specify those directories in *custom\_icon\_paths* argument for this plugin.

The widget will look for icons with a png or svg extension.

The order of icon search is:

- dirs in *custom\_icon\_paths* config argument
- ~/.icons

• built-in qtile icons

Supported bar orientations: horizontal only

### **Configuration options**

key	default	description
background	None	Widget background color
custom_icon_path		List of folders where to search icons beforeusing built-in icons or icons in ~/.icons dir. This can also be used to providemissing icons for custom layouts. Defaults to empty list.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scale	1	Scale factor relative to the bar height. Defaults to 1
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>		When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step

# Available commands

Click to view the available commands for CurrentLayoutIcon

# 11.19 CurrentScreen

# class libqtile.widget.CurrentScreen(\*args, \*\*kwargs)

Indicates whether the screen this widget is on is currently active or not

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
active_color	'00ff00'	Color when screen is active
active_text	'A'	Text displayed when the screen is active
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
inactive_color	'ff0000'	Color when screen is inactive
inactive_text	'I'	Text displayed when the screen is inactive
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>		When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step

# 11.20 DF

### class libqtile.widget.DF(\*args, \*\*kwargs)

Disk Free Widget

By default the widget only displays if the space is less than warn\_space.

Supported bar orientations: horizontal and vertical

### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{p} ({uf}{m} {r:. 0f}%)'	String format (p: partition, s: size, f: free space, uf: user free space, m: measure, r: ratio (uf/s))
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
measure	'G'	Measurement (G, M, B)
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
partition	'/'	the partition to check space
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	60	The update interval.
visible_on_warn	True	Only display if warning
warn_color	'ff0000'	Warning color
warn_space	2	Warning space in scale defined by the measure option.

# 11.21 GenPollCommand

# class libqtile.widget.GenPollCommand(\*args, \*\*kwargs)

A generic text widget to display output from scripts or shell commands

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
cmd	None	command line as a string or list of arguments to execute
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
<pre>max_chars</pre>	0	Maximum number of characters to display in widget.
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
shell	False	run command through shell to enable piping and shell expansion
update_interval	60	update time in seconds

### Available commands

# 11.22 GenPollText

# class libqtile.widget.GenPollText(\*args, \*\*kwargs)

A generic text widget that polls using poll function to get the text

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
func	None	Poll Function
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.

#### Available commands

Click to view the available commands for GenPollText

# 11.23 GenPollUrl

# class libqtile.widget.GenPollUrl(\*args, \*\*kwargs)

A generic text widget that polls an url and parses it using parse function

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
data	None	Post Data
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
headers	{}	Extra Headers
json	True	Is Json?
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>		When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.
url	None	Url
user_agent	'Qtile'	Set the user agent
xml	False	Is XML?

# 11.24 GmailChecker

# class libqtile.widget.GmailChecker(\*args, \*\*kwargs)

A simple gmail checker. If 'status\_only\_unseen' is True - set 'fmt' for one argument, ex. 'unseen: {0}'

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
display_fmt	'inbox[{0}], unseen[{1}]'	Display format
email_path	'INBOX'	email_path
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
password	None	password
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
<pre>scroll_repeat</pre>	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
status_only_unse	False	Only show unseen messages
update_interval	30	Update time in seconds.
username	None	username

# 11.25 GroupBox

### class libqtile.widget.GroupBox(\*args, \*\*kwargs)

A widget that graphically displays the current group. All groups are displayed by their label. If the label of a group is the empty string that group will not be displayed.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
active	'FFFFFF'	Active group font colour
background	None	Widget background color
block_highlight_	None	Selected group font colour
borderwidth	3	Current group border width
center_aligned	True	center-aligned group box
disable_drag	False	Disable dragging and dropping of group names on widget
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
hide_unused	False	Hide groups that have no windows and that are not displayed on any screen.
highlight_color	['000000', '282828']	Active group highlight color when using 'line' highlight method.
highlight_method	'border'	Method of highlighting ('border', 'block', 'text', or 'line')Uses *_ <i>border</i> color settings
inactive	'404040'	Inactive group font colour
invert_mouse_whe	False	Whether to invert mouse wheel group movement
margin	3	Margin inside the box
margin_x	None	X Margin. Overrides 'margin' if set
margin_y	None	Y Margin. Overrides 'margin' if set
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
other_current_sc	'404040'	Border or line colour for group on other screen when focused.
other_screen_bor	'404040'	Border or line colour for group on other screen when unfocused.
padding	None	Padding. Calculated if None.
padding_x	None	X Padding. Overrides 'padding' if set
padding_y	None	Y Padding. Overrides 'padding' if set
rounded	True	To round or not to round box borders
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)

continues on next page

key	default	description
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
spacing	None	Spacing between groups(if set to None, will be equal to mar- gin_x)
this_current_scr	'215578'	Border or line colour for group on this screen when focused.
this_screen_bord	'215578'	Border or line colour for group on this screen when unfocused.
toggle	True	Enable toggling of group when clicking on same group name
urgent_alert_met	'border'	Method for alerting you of WM urgent hints (one of 'border', 'text', 'block', or 'line')
urgent_border	'FF0000'	Urgent border or line color
urgent_text	'FF0000'	Urgent group font color
use_mouse_wheel	True	Whether to use mouse wheel events
visible_groups	None	Groups that will be visible. If set to None or [], all groups will be visible.Visible groups are identified by name not by their dis- played label.

# 11.26 HDDBusyGraph

# class libqtile.widget.HDDBusyGraph(\*args, \*\*kwargs)

Display HDD busy time graph

Parses /sys/block/<dev>/stat file and extracts overall device IO usage, based on io\_ticks's value. See https://www.kernel.org/doc/Documentation/block/stat.txt

Supported bar orientations: horizontal only

key	default	description
background	None	Widget background color
border_color	'215578'	Widget border color
border_width	2	Widget border width
device	'sda'	Block device to display info for
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
samples	100	Count of graph samples.
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

Click to view the available commands for HDDBusyGraph

# 11.27 HDDGraph

# class libqtile.widget.HDDGraph(\*args, \*\*kwargs)

Display HDD free or used space graph

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
border_color	'215578'	Widget border color
border_width	2	Widget border width
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
path	'/'	Partition mount point.
samples	100	Count of graph samples.
space_type	'used'	free/used
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

# 11.28 IdleRPG

# class libqtile.widget.IdleRPG(\*args, \*\*kwargs)

A widget for monitoring and displaying IdleRPG stats.

```
# display idlerpg stats for the player 'pants' on freenode's #idlerpg
widget.IdleRPG(url="http://xethron.lolhosting.net/xml.php?player=pants")
```

Widget requirements: xmltodict.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
data	None	Post Data
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'IdleRPG: {online} TTL: {ttl}'	Display format
headers	{}	Extra Headers
json	True	Is Json?
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.
url	None	Url
user_agent	'Qtile'	Set the user agent
xml	False	Is XML?

Click to view the available commands for IdleRPG

# 11.29 Image

#### class libqtile.widget.Image(\*args, \*\*kwargs)

Display a PNG image on the bar

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
filename	None	Image filename. Can contain '~'
margin	3	Margin inside the box
margin_x	None	X Margin. Overrides 'margin' if set
margin_y	None	Y Margin. Overrides 'margin' if set
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
rotate	0.0	rotate the image in degrees counter-clockwise
scale	True	Enable/Disable image scaling

#### Available commands

Click to view the available commands for Image

# 11.30 ImapWidget

#### class libqtile.widget.ImapWidget(\*args, \*\*kwargs)

Email IMAP widget

This widget will scan one of your imap email boxes and report the number of unseen messages present. I've configured it to only work with imap with ssl. Your password is obtained from the Gnome Keyring.

Writing your password to the keyring initially is as simple as (changing out <userid> and <password> for your userid and password):

1) create the file ~/.local/share/python\_keyring/keyringrc.cfg with the following contents:

```
[backend]
default-keyring=keyring.backends.Gnome.Keyring
keyring-path=/home/<userid>/.local/share/keyring/
```

2) Execute the following python shell script once:

```
#!/usr/bin/env python3
import keyring
user = <userid>
password = <password>
keyring.set_password('imapwidget', user, password)
```

mbox names must include the path to the mbox (except for the default INBOX). So, for example if your mailroot is ~/Maildir, and you want to look at the mailbox at HomeMail/fred, the mbox setting would be: mbox="~/Maildir/HomeMail/fred". Note the nested sets of quotes! Labels can be whatever you choose, of course.

Widget requirements: keyring.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
label	'INBOX'	label for display
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
mbox	'"INBOX"'	mailbox to fetch
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
server	None	email server name
update_interval	600	Update interval in seconds, if none, the widget updates only once.
user	None	email username

# 11.31 KeyboardKbdd

### class libqtile.widget.KeyboardKbdd(\*args, \*\*kwargs)

Widget for changing keyboard layouts per window, using kbdd

kbdd should be installed and running, you can get it from: https://github.com/qnikst/kbdd

The widget also requires dbus-next.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
colours	None	foreground colour for each layouteither 'None' or a list of colours.example: ['ffffff', 'E6F0AF'].
configured_keybo		your predefined list of keyboard layouts.example: ['us', 'ir', 'es']
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
<pre>scroll_delay</pre>	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1	Update interval in seconds.

### Available commands

Click to view the available commands for KeyboardKbdd

# 11.32 KeyboardLayout

# class libqtile.widget.KeyboardLayout(\*args, \*\*kwargs)

Widget for changing and displaying the current keyboard layout

To use this widget effectively you need to specify keyboard layouts you want to use (using "configured\_keyboards") and bind function "next\_keyboard" to specific keys in order to change layouts.

For example:

Key([mod], "space", lazy.widget["keyboardlayout"].next\_keyboard(), desc="Next keyboard layout."),

When running Qtile with the X11 backend, this widget requires setxkbmap to be available. Xmodmap will also be used if .Xmodmap file is available.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
configured_keybo	['us']	A list of predefined keyboard layouts represented as strings. For example: ['us', 'us colemak', 'es', 'fr'].
display_map	{}	Custom display of layout. Key should be in format 'layout vari- ant'. For example: {'us': 'us', 'lt sgs': 'sgs', 'ru phonetic': 'ru'}
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
option	None	string of setxkbmap option. Ex., 'compose:menu,grp_led:scroll'
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1	Update time in seconds.

Click to view the available commands for KeyboardLayout

# 11.33 KhalCalendar

#### class libqtile.widget.KhalCalendar(\*args, \*\*kwargs)

Khal calendar widget

This widget will display the next appointment on your Khal calendar in the qtile status bar. Appointments within the "reminder" time will be highlighted.

Widget requirements: dateutil.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'FFFF33'	default foreground color
lookahead	7	days to look ahead in the calendar
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
reminder_color	'FF0000'	color of calendar entries during reminder time
remindertime	10	reminder time in minutes
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.

### **Configuration options**

#### Available commands

Click to view the available commands for KhalCalendar

# 11.34 LaunchBar

#### class libqtile.widget.LaunchBar(\*args, \*\*kwargs)

A widget that display icons to launch the associated command.

Text will displayed when no icon is found.

Optional requirements: pyxdg for finding the icon path if it is not provided in the progs tuple.

Supported bar orientations: horizontal only

key	default	description
background	None	Widget background color
default_icon	<pre>'/usr/share/ icons/oxygen/ 256x256/ mimetypes/ application-x-ex png'</pre>	Default icon not found
font	'sans'	Text font
fontshadow	None	Font shadow color, default is None (no shadow)
fontsize	None	Font pixel size. Calculated if None.
foreground	'#ffffff'	Text colour.
icon_size	None	Size of icons. None to fit to bar.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	2	Padding between icons
padding_y	0	Vertical adjustment for icons.
progs	[]	A list of tuples (software_name or icon_path, com- mand_to_execute, comment), for example: [('thunderbird', 'thunderbird -safe-mode', 'launch thunderbird in safe mode'), ('/path/to/icon.png', 'qshell:self.qtile.shutdown()', 'logout from qtile')]
text_only	False	Don't use any icons.
theme_path	None	Path to icon theme to be used by pyxdg for icons. None will use default icon theme.

Click to view the available commands for LaunchBar

# 11.35 Load

## class libqtile.widget.Load(\*args, \*\*kwargs)

A small widget to show the load averages of the system. Depends on psutil.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'Load({time}):{1 2f}'	The format in which to display the results.
markup	True	Whether or not to use pango markup
<pre>max_chars</pre>	0	Maximum number of characters to display in widget.
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
update_interval	1.0	The update interval for the widget

Click to view the available commands for Load

# 11.36 Maildir

# class libqtile.widget.Maildir(\*args, \*\*kwargs)

A simple widget showing the number of new mails in maildir mailboxes

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
empty_color	None	Display color when no new mail is available
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
hide_when_empty maildir_path	False '~/Mail'	Whether not to display anything if the subfolder has no new mail path to the Maildir folder
markup	True	Whether or not to use pango markup
<pre>max_chars</pre>	0	Maximum number of characters to display in widget.
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
nonempty_color	None	Display color when new mail is available
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
separator	1 1	the string to put between the subfolder strings.
sub_folders	<pre>[{'label': 'Home mail', 'path': 'INBOX'}, {'label': 'Home junk', 'path': 'spam'}]</pre>	List of subfolders to scan. Each subfolder is a dict of <i>path</i> and <i>label</i> .
subfolder_fmt	'{label}: {value}'	Display format for one subfolder
total	False	Whether or not to sum subfolders into a grand total. The first label will be used.
update_interval	600	Update interval in seconds, if none, the widget updates only once.

Click to view the available commands for Maildir

# 11.37 Memory

### class libqtile.widget.Memory(\*args, \*\*kwargs)

Display memory/swap usage.

The following fields are available in the *format* string:

- MemUsed: Memory in use.
- MemTotal: Total amount of memory.
- MemFree: Amount of memory free.
- MemPercent: Memory in use as a percentage.
- Buffers: Buffer amount.
- Active: Active memory.
- Inactive: Inactive memory.
- Shmem: Shared memory.
- SwapTotal: Total amount of swap.
- SwapFree: Amount of swap free.
- SwapUsed: Amount of swap in use.
- SwapPercent: Swap in use as a percentage.
- mm: Measure unit for memory.
- ms: Measure unit for swap.

Widget requirements: psutil.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{MemUsed: .0f}{mm}/ {MemTotal: .0f}{mm}'	Formatting for field names.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
measure_mem	'M'	Measurement for Memory (G, M, K, B)
measure_swap	'M'	Measurement for Swap (G, M, K, B)
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1.0	Update interval for the Memory

# 11.38 MemoryGraph

### class libqtile.widget.MemoryGraph(\*args, \*\*kwargs)

Displays a memory usage graph.

Widget requirements: psutil.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
border_color	'215578'	Widget border color
border_width	2	Widget border width
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions
		and lazy calls.
samples	100	Count of graph samples.
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

### Available commands

# 11.39 Moc

#### class libqtile.widget.Moc(\*args, \*\*kwargs)

A simple MOC widget.

Show the artist and album of now listening song and allow basic mouse control from the bar:

- toggle pause (or play if stopped) on left click;
- skip forward in playlist on scroll up;
- skip backward in playlist on scroll down.

MOC (http://moc.daper.net) should be installed.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
noplay_color	'cecece'	Text colour when not playing.
padding	None	Padding. Calculated if None.
play_color	'00ff00'	Text colour when playing.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	0.5	Update Time in seconds.

# 11.40 Mpd2

#### **Parameters**

**status\_format:** format string to display status

### For a full list of values, see: MPDClient.status() and MPDClient.currentsong()

https://musicpd.org/doc/protocol/command\_reference.html#command\_status https://musicpd.org/doc/protocol/tags.html Default:

```
'{play_status} {artist}/{title} \
    [{repeat}{random}{single}{consume}{updating_db}]'
``play_status`` is a string from ``play_states`` dict
Note that the ``time`` property of the song renamed to ``fulltime``
to prevent conflicts with status information during formating.
```

#### idle\_format:

format string to display status when no song is in queue.

Default:

```
'{play_status} {idle_message} \
    [{repeat}{random}{single}{consume}{updating_db}]'
Note that the ``artist`` key fallbacks to similar keys in specific_
    order.
(``artist`` -> ``albumartist`` -> ``performer`` ->
    -> ``composer`` -> ``conductor`` -> ``ensemble``)
```

#### idle\_message:

text to display instead of song information when MPD is idle. (i.e. no song in queue)

Default:: "MPD IDLE"

#### undefined\_value:

text to display when status key is undefined

Default:: "Undefined"

#### prepare\_status:

dict of functions to replace values in status with custom characters.

```
f(status, key, space_element) => str
```

New functionality allows use of a dictionary of plain strings.

Default:

```
status_dict = {
    'repeat': 'r',
    'random': 'z',
    'single': '1',
    'consume': 'c',
    'updating_db': 'U'
}
```

#### format\_fns:

A dict of functions to format the various elements.

'Tag':  $f(str) \Rightarrow str$ 

Default:: { 'all': lambda s: cgi.escape(s) }

**N.B. if 'all' is present, it is processed on every element of song\_info** before any other formatting is done.

### mouse\_buttons:

A dict of mouse button numbers to actions

### Widget requirements: python-mpd2\_. ..\_python-mpd2: https://pypi.org/project/python-mpd2/

Supported bar orientations: horizontal and vertical

### **Configuration options**

key	default	description
background	None	Widget background color
color_progress	None	Text color to indicate track progress.
command	<function default_cmd at 0x7ff4640a5090&gt;</function 	command to be executed by mapped mouse button.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.

# 11.41 Mpris2

#### class libqtile.widget.Mpris2(\*args, \*\*kwargs)

An MPRIS 2 widget

A widget which displays the current track/artist of your favorite MPRIS player. This widget scrolls the text if neccessary and information that is displayed is configurable.

The widget relies on players broadcasting signals when the metadata or playback status changes. If you are getting inconsistent results then you can enable background polling of the player by setting the *poll\_interval* parameter. This is disabled by default.

Basic mouse controls are also available: button 1 = play/pause, scroll up = next track, scroll down = previous track.

Widget requirements: dbus-next.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
display_metadata	['xesam:title', 'xesam:album', 'xesam:artist']	(Deprecated) Which metadata identifiers to display.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'{xesam:title} - {xesam:album} -	Format string for displaying metadata. See http: //www.freedesktop.org/wiki/Specifications/mpris-spec/ metadata/#index5h3 for available values
	{xesam:artist}'	
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
name	'audacious'	Name of the MPRIS widget.
no_metadata_text	'No metadata for current track'	Text to show when track has no metadata
objname	None	DBUS MPRIS 2 compatible player identifier- Find it out with dbus-monitor - Also see: http://specifications.freedesktop.org/ mpris-spec/latest/#Bus-Name-Policy. None will listen for noti- fications from all MPRIS2 compatible players.
padding	None	Padding. Calculated if None.
paused_text	'Paused: {track}'	Text to show when paused
playing_text	'{track}'	Text to show when playing
poll_interval	0	Periodic background polling interval of player (0 to disable polling).
scroll	True	Whether text should scroll.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
<pre>scroll_repeat</pre>	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
separator	т т ,	Separator for metadata fields that are a list.
stop_pause_text	None	(Deprecated) Optional text to display when in the stopped/paused state
stopped_text	11	Text to show when stopped

# 11.42 Net

class libqtile.widget.Net(\*args, \*\*kwargs)
 Displays interface down and up speed
 Widget requirements: psutil.
 Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	<pre>'{interface}: {down:6. 2f}{down_suffix: 2f}{up_suffix:&lt;2</pre>	Display format of down/upload/total speed of given interfaces
interface	None	List of interfaces or single NIC as string to monitor, None to display all active NICs combined
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
prefix	None	Use a specific prefix for the unit of the speed.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1	The update interval.
use_bits	False	Use bits instead of bytes per second?

# 11.43 NetGraph

#### class libqtile.widget.NetGraph(\*args, \*\*kwargs)

Display a network usage graph.

Widget requirements: psutil.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
bandwidth_type	'down'	down(load)/up(load)
border_color	'215578'	Widget border color
border_width	2	Widget border width
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
interface	'auto'	Interface to display info for ('auto' for detection)
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
samples	100	Count of graph samples.
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

#### Available commands

Click to view the available commands for NetGraph

# 11.44 Notify

#### class libqtile.widget.Notify(\*args, \*\*kwargs)

#### A notify widget

This widget can handle actions provided by notification clients. However, only the default action is supported, so if a client provides multiple actions then only the default (first) action can be invoked. Some programs will provide their own notification windows if the notification server does not support actions, so if you want your notifications to handle more than one action then specify False for the action option to disable all action handling. Unfortunately we cannot specify the capability for exactly one action.

Supported bar orientations: horizontal and vertical

# 11.45 NvidiaSensors

## class libqtile.widget.NvidiaSensors(\*args, \*\*kwargs)

Displays temperature, fan speed and performance level Nvidia GPU.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
foreground_alert	'ff0000'	Foreground colour alert
format	'{temp}°C'	Display string format. Three options available: {temp} - tem- perature, {fan_speed} and {perf} - performance level
gpu_bus_id		GPU's Bus ID, ex: 01:00.0. If leave empty will display all available GPU's
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
threshold	70	If the current temperature value is above, then change to fore- ground_alert colour
update_interval	2	Update interval in seconds.

#### Available commands

Click to view the available commands for NvidiaSensors

## 11.46 OpenWeather

## class libqtile.widget.OpenWeather(\*args, \*\*kwargs)

A weather widget, data provided by the OpenWeather API.

#### Some format options:

- location\_city
- location\_cityid
- location\_country
- location\_lat
- location\_long
- weather
- weather\_details
- units\_temperature
- units\_wind\_speed
- isotime
- humidity
- pressure
- sunrise
- sunset
- temp
- visibility
- wind\_speed
- wind\_deg
- wind\_direction
- main\_feels\_like
- main\_temp\_min
- main\_temp\_max
- clouds\_all
- icon

Icon support is available but you will need a suitable font installed. A default icon mapping is provided (OpenWeather.symbols) but changes can be made by setting weather\_symbols. Available icon codes can be viewed here: https://openweathermap.org/weather-conditions#Icon-list

Supported bar orientations: horizontal and vertical

key	default	description
app_key	'7834197c2338888	Open Weather access key. A default is provided, butn for prolonged use obtaining your own is suggested:n https://home.openweathermap.org/users/sign_up
background	None	Widget background color
cityid	None	City ID. Can be looked up on e.g.:n https://openweathermap.org/findn Takes precedence over location and coordinates.n Note that this is not equal to a WOEID.
coordinates	None	Dictionary containing latitude and longituden Example: coordi- nates={"longitude": "77.22",n "latitude": "28.67"}
data	None	Post Data
dateformat	'%Y-%m-%d '	Format for dates, defaults to ISO.n For details see: https://docs. python.org/3/library/time.html#time.strftime
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	<pre>'{location_city} {main_temp}   `{units_temperat {humidity}% {weather_details</pre>	Dispray format
headers	{}	Extra Headers
json	True	Is Json?
language	'en'	Language of response. List of languages supported cann be seen at: https://openweathermap.org/current undern Multilin-gual support
location	None	Name of the city. Country name can be appended like cam- bridge,NZ. Takes precedence over zip-code.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
metric	True	True to use metric/C, False to use imperial/F
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.

continues on next page

key	default	description
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
timeformat	'%H:%M'	Format for times, defaults to ISO.n For details see: https://docs. python.org/3/library/time.html#time.strftime
update_interval	600	Update interval in seconds, if none, the widget updates only once.
url	None	Url
user_agent	'Qtile'	Set the user agent
weather_symbols	{}	Dictionary of weather symbols. Can be used to override default symbols.
xml	False	Is XML?
zip	None	Zip code (USA) or "zip code,country code" forn other countries. E.g. 12345,NZ. Takes precedence overn coordinates.

# 11.47 Pomodoro

### class libqtile.widget.Pomodoro(\*args, \*\*kwargs)

Pomodoro technique widget

Supported bar orientations: horizontal and vertical

### **Configuration options**

key	default	description
background	None	Widget background color
color_active	'00ff00'	Colour then pomodoro is running
color_break	'ffff00'	Colour then it is break time
color_inactive	'ff0000'	Colour then pomodoro is inactive
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
length_long_brea	15	Length of a long break in minutes
length_pomodori	25	Length of one pomodori in minutes
length_short_bre	5	Length of a short break in minutes
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.

continues on next page

key	default	description
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
<pre>notification_on</pre>	True	Turn notifications on
num_pomodori	4	Number of pomodori to do in a cycle
padding	None	Padding. Calculated if None.
prefix_active	11	Prefix then app is active
prefix_break	'B '	Prefix during short break
prefix_inactive	'POMODORO'	Prefix when app is inactive
<pre>prefix_long_brea</pre>	'LB '	Prefix during long break
prefix_paused	'PAUSE'	Prefix during pause
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
update_interval	1	Update interval in seconds, if none, the widget updates whenever the event loop is idle.

	Table	6 - continued	from previous	page
--	-------	---------------	---------------	------

Click to view the available commands for Pomodoro

## 11.48 Prompt

class libqtile.widget.Prompt(\*args, \*\*kwargs)

A widget that prompts for user input

Input should be started using the .start\_input() method on this class.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
bell_style	'audible'	Alert at the begin/end of the command history. Possible values: 'audible' (X11 only), 'visual' and None.
cursor	True	Show a cursor
cursor_color	'bef098'	Color for the cursor and text over it.
cursorblink	0.5	Cursor blink rate. 0 to disable.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
<pre>ignore_dups_hist</pre>	False	Don't store duplicates in history
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>max_history</pre>	100	Commands to keep in history. 0 for no limit.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
prompt	'{prompt}: '	Text displayed at the prompt
record_history	True	Keep a record of executed commands
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
visual_bell_colc		Color for the visual bell (changes prompt background).
visual_bell_time	0.2	Visual bell duration (in seconds).

Click to view the available commands for *Prompt* 

# 11.49 PulseVolume

#### class libqtile.widget.PulseVolume(\*args, \*\*kwargs)

Volume widget for systems using PulseAudio.

The widget connects to the PulseAudio server by using the libpulse library and so should be updated virtually instantly rather than needing to poll the volume status regularly (NB this means that the update\_interval parameter serves no purpose for this widget).

The widget relies on the pulsectl\_asyncio library to access the libpulse bindings.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
cardid	None	Card Id
channel	'Master'	Channel
check_mute_comma	None	Command to check mute status
check_mute_strin	'[off]'	String expected from check_mute_command when volume is muted.When the output of the command matches this string, theaudio source is treated as muted.
device	'default'	Device Name
emoji	False	Use emoji to display volume states, only if theme_path is not set. The specified font needs to contain the correct unicode characters.
emoji_list	['', '', '', '']	List of emojis/font-symbols to display volume states, only if emoji is set. List contains 4 symbols, from lowest volume to highest.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
get_volume_comma	None	Command to get the current volume. The expected output should include 1-3 numbers and a % sign.
limit_max_volume	False	Limit maximum volume to 100%
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
mute_command	None	Mute command
padding	3	Padding left and right. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)

continues on next page

key	default	description
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
step	2	Volume change for up an down commands in percentage.Only used if volume_up_command and volume_down_command are not set.
theme_path	None	Path of the icons
update_interval	0.2	Update time in seconds.
volume_app	None	App to control volume
volume_down_comm	None	Volume down command
volume_up_comman	None	Volume up command

### Table 7 – continued from previous page

#### Available commands

Click to view the available commands for PulseVolume

# 11.50 QuickExit

## class libqtile.widget.QuickExit(\*args, \*\*kwargs)

A button to shut down Qtile. When clicked, a countdown starts. Clicking the button again stops the countdown and prevents Qtile from shutting down.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
countdown_format	'[ {} seconds ]'	The text displayed when counting down.
countdown_start	5	The number to count down from.
default_text	'[ shutdown ]'	The text displayed on the button.
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
timer_interval	1	The countdown interval.

Click to view the available commands for QuickExit

# 11.51 Sep

class libqtile.widget.Sep(\*args, \*\*kwargs)

A visible widget separator

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
foreground	'888888'	Separator line colour.
linewidth	1	Width of separator line.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	2	Padding on either side of separator.
size_percent	80	Size as a percentage of bar size (0-100).

Click to view the available commands for Sep

## 11.52 She

class libqtile.widget.She(\*args, \*\*kwargs)

Widget to display the Super Hybrid Engine status

Can display either the mode or CPU speed on eeepc computers.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
device	<pre>'/sys/devices/ platform/ eeepc/cpufv'</pre>	sys path to cpufv
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'speed'	Type of info to display "speed" or "name"
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
update_interval	0.5	Update Time in seconds.

## 11.53 Spacer

### class libqtile.widget.Spacer(\*args, \*\*kwargs)

Just an empty space on the bar

Often used with length equal to bar.STRETCH to push bar widgets to the right or bottom edge of the screen.

### Parameters

length

Length of the widget. Can be either bar.STRETCH or a length in pixels.

#### width

DEPRECATED, same as length.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.

#### Available commands

Click to view the available commands for Spacer

## 11.54 StatusNotifier

#### class libqtile.widget.StatusNotifier(\*args, \*\*kwargs)

A 'system tray' widget using the freedesktop StatusNotifierItem specification.

As per the specification, app icons are first retrieved from the user's current theme. If this is not available then the app may provide its own icon. In order to use this functionality, users are recommended to install the pyxdg module to support retrieving icons from the selected theme.

Left-clicking an icon will trigger an activate event.

**Note:** Context menus are not currently supported by the official widget. However, a modded version of the widget which provides basic menu support is available from elParaguayo's qtile-extras repo.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
icon_size	16	Icon width
icon_theme	None	Name of theme to use for app icons
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	3	Padding between icons

### Available commands

Click to view the available commands for StatusNotifier

## 11.55 StockTicker

### class libqtile.widget.StockTicker(\*args, \*\*kwargs)

A stock ticker widget, based on the alphavantage API. Users must acquire an API key from https://www. alphavantage.co/support/#api-key

The widget defaults to the TIME\_SERIES\_INTRADAY API function (i.e. stock symbols), but arbitrary Alpha Vantage API queries can be made by passing extra arguments to the constructor.

```
# Display AMZN
widget.StockTicker(apikey=..., symbol="AMZN")
# Display BTC
widget.StockTicker(
    apikey=..., function="DIGITAL_CURRENCY_INTRADAY", symbol="BTC", market="USD"
)
```

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
data	None	Post Data
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
func	'TIME_SERIES_INT	The default API function to query
function		DEPRECATED: Use func.
headers	{}	Extra Headers
interval	'1min'	The default latency to query
json	True	Is Json?
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step
update_interval	600	Update interval in seconds, if none, the widget updates only once.
url	None	Url
user_agent	'Qtile'	Set the user agent
xml	False	Is XML?

Click to view the available commands for *StockTicker* 

## 11.56 SwapGraph

#### class libqtile.widget.SwapGraph(\*args, \*\*kwargs)

Display a swap info graph.

Widget requirements: psutil.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
border_color	'215578'	Widget border color
border_width	2	Widget border width
fill_color	'1667EB.3'	Fill color for linefill graph
frequency	1	Update frequency in seconds
graph_color	'18BAEB'	Graph color
line_width	3	Line width
margin_x	3	Margin X
margin_y	3	Margin Y
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions
		and lazy calls.
samples	100	Count of graph samples.
start_pos	'bottom'	Drawer starting position ('bottom'/'top')
type	'linefill'	'box', 'line', 'linefill'

### Available commands

Click to view the available commands for SwapGraph

## 11.57 Systray

class libqtile.widget.Systray(\*args, \*\*kwargs)

A widget that manages system tray.

Only one Systray widget is allowed. Adding additional Systray widgets will result in a ConfigError.

**Note:** Icons will not render correctly where the bar/widget is drawn with a semi-transparent background. Instead, icons will be drawn with a transparent background.

If using this widget it is therefore recommended to use a fully opaque background colour or a fully transparent one.

Supported bar orientations: horizontal and vertical

Only available on the following backends: x11

key	default	description
background	None	Widget background color
icon_size	20	Icon width
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	5	Padding between icons

Click to view the available commands for Systray

## 11.58 TaskList

#### class libqtile.widget.TaskList(\*args, \*\*kwargs)

Displays the icon and name of each window in the current group

Contrary to WindowTabs this is an interactive widget. The window that currently has focus is highlighted.

Optional requirements: pyxdg is needed to use theme icons and to display icons on Wayland.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description
background	None	Widget background color
border	'215578'	Border colour
borderwidth	2	Current group border width
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
highlight_method	'border'	Method of highlighting (one of 'border' or 'block') Uses *_border color settings
icon_size	None	Icon size. (Calculated if set to None. Icons are hidden if set to 0.)
margin	3	Margin inside the box
margin_x	None	X Margin. Overrides 'margin' if set
margin_y	None	Y Margin. Overrides 'margin' if set
<pre>markup_floating</pre>	None	Text markup of the floating window state. Supports pan- gomarkup with markup=True.e.g., "{}" or " <span under-<br="">line="low"&gt;{}</span> "
markup_focused	None	Text markup of the focused window state. Supports pan- gomarkup with markup=True.e.g., "{}" or " <span under-<br="">line="low"&gt;{}</span> "
markup_maximized	None	Text markup of the maximized window state. Supports pangomarkup with markup=True.e.g., "{}" or " <span under-line="low">{}</span> "
markup_minimized	None	Text markup of the minimized window state. Supports pangomarkup with markup=True.e.g., "{}" or " <span under-<br="">line="low"&gt;{}</span> "

continues on next page

line		
key	default	description
markup_normal	None	Text markup of the normal window state. Supports pan- gomarkup with markup=True.e.g., "{}" or " <span under-<br="">line="low"&gt;{}</span> "
<pre>max_title_width</pre>	None	Max size in pixels of task title.(if set to None, as much as available.)
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	3	Padding inside the box
padding_x	None	X Padding. Overrides 'padding' if set
padding_y	None	Y Padding. Overrides 'padding' if set
parse_text	None	Function to parse and modify window names. e.g. func- tion in config that removes excess strings from window name: def my_func(text) for string in [" - Chromium", " - Fire- fox"]: text = text.replace(string, "") return textthen set option parse_text=my_func
rounded	True	To round or not to round borders
spacing	None	Spacing between tasks.(if set to None, will be equal to margin_x)
theme_mode	None	When to use theme icons. <i>None</i> = never, <i>preferred</i> = use if avail- able, <i>fallback</i> = use if app does not provide icon directly. <i>pre-</i> <i>ferred</i> and <i>fallback</i> have identical behaviour on Wayland.
theme_path	None	Path to icon theme to be used by pyxdg for icons. None will use default icon theme.
title_width_meth	None	Method to compute the width of task title. (None, 'uni- form'.)Defaults to None, the normal behaviour.
<pre>txt_floating</pre>	'V '	Text representation of the floating window state. e.g., "V " or " "
txt_maximized	'[] '	Text representation of the maximized window state. e.g., "[] " or " "
txt_minimized	- '	Text representation of the minimized window state. e.g., "_ " or " "
unfocused_border	None	Border color for unfocused windows. Affects only hight- light_method 'border' and 'block'. Defaults to None, which means no special color.
urgent_alert_met	'border'	Method for alerting you of WM urgent hints (one of 'border' or 'text')
urgent_border	'FF0000'	Urgent border color
window_name_loca	False	Whether to show the location of the window in the title.
window_name_loca	0	The offset given to the window location

# 11.59 TextBox

## class libqtile.widget.TextBox(\*args, \*\*kwargs)

A flexible textbox that can be updated from bound keys, scripts, and qshell.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Text font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font pixel size. Calculated if None.
foreground	'#ffffff'	Foreground colour.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding left and right. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step

# 11.60 ThermalSensor

### class libqtile.widget.ThermalSensor(\*args, \*\*kwargs)

Widget to display temperature sensor information

For using the thermal sensor widget you need to have lm-sensors installed. You can get a list of the tag\_sensors executing "sensors" in your terminal. Then you can choose which you want, otherwise it will display the first available.

Widget requirements: psutil.

Supported bar orientations: horizontal and vertical

key	default	description
background	None	Widget background color
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
foreground_alert	'ff0000'	Foreground colour alert
format	'{temp:. 1f}{unit}'	Display string format. Three options available: {temp} - temperature, {tag} - tag of the temperature sensor, and {unit} - $^{\circ}C$ or $^{\circ}F$
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
metric	True	True to use metric/C, False to use imperial/F
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
tag_sensor	None	Tag of the temperature sensor. For example: "temp1" or "Core $0$ "
threshold	70	If the current temperature value is above, then change to fore- ground_alert colour
update_interval	2	Update interval in seconds

Click to view the available commands for ThermalSensor

# 11.61 ThermalZone

### class libqtile.widget.ThermalZone(\*args, \*\*kwargs)

Thermal zone widget.

This widget was made to read thermal zone files and transform values to human readable format. You can set zone parameter to any standard thermal zone file from /sys/class/thermal directory.

Supported bar orientations: horizontal only

key	default	description	
background	None	Widget background color	
crit	70	Critical temperature level	
fgcolor_crit	'ff0000'	Font color on critical values	
fgcolor_high	'ffaa00'	Font color on high values	
fgcolor_normal	'ffffff'	Font color on normal values	
fmt	'{}' To format the string returned by the widget. For exa clock widget returns '08:46' we can do fmt='time 'time 08:46' on the widget. To format the individual hour and minutes use the format paramater of the whas one)		
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
foreground	'ffffff'	Foreground colour	
format	'{temp}°C'	Display format	
<pre>format_crit</pre>	'{temp}°C CRIT!'	Critical display format	
hidden	False	Set True to only show if critical value reached	
high	50	High themperature level	
markup	True	Whether or not to use pango markup	
<pre>max_chars</pre>	0	Maximum number of characters to display in widget.	
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
padding	None	Padding. Calculated if None.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
scroll_fixed_wid	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step	
update_interval	2.0	Update interval	
zone	<pre>'/sys/class/ thermal/ thermal_zone0/ temp'</pre>	Thermal zone	

Click to view the available commands for *ThermalZone* 

## 11.62 Volume

#### class libqtile.widget.Volume(\*args, \*\*kwargs)

Widget that display and change volume

By default, this widget uses amixer to get and set the volume so users will need to make sure this is installed. Alternatively, users may set the relevant parameters for the widget to use a different application.

If theme\_path is set it draw widget as icons.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description	
background	None	Widget background color	
cardid	None	Card Id	
channel	'Master'	Channel	
check_mute_comma	None	Command to check mute status	
check_mute_strin	'[off]'	String expected from check_mute_command when volume is muted.When the output of the command matches this string, theaudio source is treated as muted.	
device	'default'	Device Name	
emoji	False	Use emoji to display volume states, only if theme_path is not set. The specified font needs to contain the correct unicode characters.	
emoji_list	['', '', '', '']	List of emojis/font-symbols to display volume states, only if emoji is set. List contains 4 symbols, from lowest volume to highest.	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
foreground	'ffffff'	Foreground colour	
get_volume_comma	None	Command to get the current volume. The expected output should include 1-3 numbers and a % sign.	
markup	True	Whether or not to use pango markup	
max_chars	0	Maximum number of characters to display in widget.	
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
mute_command	None	Mute command	
padding	3	Padding left and right. Calculated if None.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	

continues on next page

key	default	description
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
step	2	Volume change for up an down commands in percentage.Only used if volume_up_command and volume_down_command are not set.
theme_path	None	Path of the icons
update_interval	0.2	Update time in seconds.
volume_app	None	App to control volume
volume_down_comm	None	Volume down command
volume_up_comman	None	Volume up command

### Table 9 – continued from previous page

Click to view the available commands for Volume

# 11.63 Wallpaper

class libqtile.widget.Wallpaper(\*args, \*\*kwargs)
 Supported bar orientations: horizontal and vertical

key	default	description	
background	None	Widget background color	
directory	'~/Pictures/ wallpapers/'		
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
foreground	'ffffff'	Foreground colour	
label	None	Use a fixed label instead of image name.	
markup	True	Whether or not to use pango markup	
max_chars	0	Maximum number of characters to display in widget.	
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
option	'fill'	How to fit the wallpaper when wallpaper_command isNone. None, 'fill' or 'stretch'.	
padding	None	Padding. Calculated if None.	
random_selection	False	If set, use random initial wallpaper and randomly cycle through the wallpapers.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
scroll_step	1	Number of pixels to scroll with each step	
wallpaper	None	Wallpaper	
wallpaper_comman	['feh', 'bg-fill']	Wallpaper command. If None, thewallpaper will be painted without the use of a helper.	

Click to view the available commands for *Wallpaper* 

## 11.64 WidgetBox

## class libqtile.widget.WidgetBox(\*args, \*\*kwargs)

A widget to declutter your bar.

WidgetBox is a widget that hides widgets by default but shows them when the box is opened.

Widgets that are hidden will still update etc. as if they were on the main bar.

Button clicks are passed to widgets when they are visible so callbacks will work.

Widgets in the box also remain accessible via command interfaces.

Widgets can only be added to the box via the configuration file. The widget is configured by adding widgets to the "widgets" parameter as follows:

```
widget.WidgetBox(widgets=[
    widget.TextBox(text="This widget is in the box"),
    widget.Memory()
    ]
),
```

Supported bar orientations: horizontal only

key	default	description	
background	None	Widget background color	
close_button_loc	'left'	Location of close button when box open ('left' or 'right')	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
foreground	'ffffff'	Foreground colour	
markup	True	Whether or not to use pango markup	
max_chars	0	Maximum number of characters to display in widget.	
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
padding	None	Padding. Calculated if None.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step	
start_opened	False	Spawn the box opened	
text_closed	'[<]'	Text when box is closed	
text_open	'[>]'	Text when box is open	
widgets	[]	A list of widgets to include in the box	

Click to view the available commands for WidgetBox

## 11.65 WindowCount

## class libqtile.widget.WindowCount(\*args, \*\*kwargs)

A simple widget to display the number of windows in the current group of the screen on which the widget is.

Supported bar orientations: horizontal and vertical

key	default	description	
background	None	Widget background color	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Text font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font pixel size. Calculated if None.	
foreground	'#ffffff'	Foreground colour.	
markup	True	Whether or not to use pango markup	
max_chars	0	Maximum number of characters to display in widget.	
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
padding	None	Padding left and right. Calculated if None.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
<pre>scroll_delay</pre>	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
<pre>scroll_step</pre>	1	Number of pixels to scroll with each step	
show_zero	False	Show window count when no windows	
<pre>text_format</pre>	'{num}'	Format for message	

Click to view the available commands for WindowCount

## 11.66 WindowName

class libqtile.widget.WindowName(\*args, \*\*kwargs)

Displays the name of the window that currently has focus

Supported bar orientations: horizontal and vertical

key	default	description	
background	None	Widget background color	
empty_group_stri	1.1	string to display when no windows are focused on current group	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
for_current_scre	False	instead of this bars screen use currently active screen	
foreground	'ffffff'	Foreground colour	
format	'{state}{name}'	format of the text	
markup	True	Whether or not to use pango markup	
max_chars	0	Maximum number of characters to display in widget.	
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
padding	None	Padding. Calculated if None.	
parse_text	None	Function to parse and modify window names. e.g. func- tion in config that removes excess strings from window name: def my_func(text) for string in [" - Chromium", " - Fire- fox"]: text = text.replace(string, "") return textthen set option parse_text=my_func	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
scroll_step	1	Number of pixels to scroll with each step	

Click to view the available commands for WindowName

## 11.67 WindowTabs

### class libqtile.widget.WindowTabs(\*args, \*\*kwargs)

Displays the name of each window in the current group. Contrary to TaskList this is not an interactive widget. The window that currently has focus is highlighted.

Supported bar orientations: horizontal and vertical

#### **Configuration options**

key	default	description
background	None Widget background color	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
<pre>mouse_callbacks</pre>	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse_text	None	Function to parse and modify window names. e.g. func- tion in config that removes excess strings from window name: def my_func(text) for string in [" - Chromium", " - Fire- fox"]: text = text.replace(string, "") return textthen set option parse_text=my_func
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
selected	(' <b>', '<!--<br-->b&gt;')</b>	Selected task indicator
separator	' '	Task separator text.

## Available commands

Click to view the available commands for WindowTabs

## 11.68 Wlan

## class libqtile.widget.Wlan(\*args, \*\*kwargs)

Displays Wifi SSID and quality.

Widget requirements: iwlib.

Supported bar orientations: horizontal only

#### **Configuration options**

key	default	description	
background	None	Widget background color	
disconnected_mes	'Disconnected'	String to show when the wlan is diconnected.	
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)	
font	'sans'	Default font	
fontshadow	None	font shadow color, default is None(no shadow)	
fontsize	None	Font size. Calculated if None.	
foreground	'ffffff'	Foreground colour	
format	'{essid} {quality}/ 70'	Display format. For percents you can use "{essid} {percent:2.0%}"	
interface	'wlan0'	The interface to monitor	
markup	True	Whether or not to use pango markup	
<pre>max_chars</pre>	0	Maximum number of characters to display in widget.	
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.	
padding	None	Padding. Calculated if None.	
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.	
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)	
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end	
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.	
scroll_hide	False	Whether the widget should hide when scrolling has finished	
scroll_interval	0.1	Time in seconds before next scrolling step	
scroll_repeat	True	Whether text should restart scrolling once the text has ended	
scroll_step	1	Number of pixels to scroll with each step	
update_interval	1	The update interval.	

#### Available commands

Click to view the available commands for *Wlan* 

## 11.69 Wttr

## class libqtile.widget.Wttr(\*args, \*\*kwargs)

Display weather widget provided by wttr.in.

To specify your own custom output format, use the special %-notation (example: 'My\_city: %t(%f), wind: %w'):

- %c Weather condition,
- %C Weather condition textual name,
- %h Humidity,
- %t Temperature (Actual),
- %f Temperature (Feels Like),
- %w Wind,
- %l Location,
- %m Moonphase,
- %M Moonday,
- %p precipitation (mm),
- %P pressure (hPa),
- %D Dawn !,
- %S Sunrise !,
- %z Zenith !,
- %s Sunset !,
- %d Dusk !. (!times are shown in the local timezone)

Add the character ~ at the beginning to get weather for some special location: ~Vostok Station or ~Eiffel Tower.

Also can use IP-addresses (direct) or domain names (prefixed with @) to specify a location: @github.com, 123.456.678.123

Specify multiple locations as dictionary

```
location={
    'Minsk': 'Minsk',
    '64.127146,-21.873472': 'Reykjavik',
}
```

Cities will change randomly every update.

Supported bar orientations: horizontal and vertical

### **Configuration options**

key	default	description
background	None	Widget background color
data	None	Post Data

continues on next page

		continued nom previous page
key	default	description
fmt	'{}'	To format the string returned by the widget. For example, if the clock widget returns '08:46' we can do fmt='time {}' do print 'time 08:46' on the widget. To format the individual strings like hour and minutes use the format paramater of the widget (if it has one)
font	'sans'	Default font
fontshadow	None	font shadow color, default is None(no shadow)
fontsize	None	Font size. Calculated if None.
foreground	'ffffff'	Foreground colour
format	'3'	Display text format. Choose presets in range 1-4 (Ex. "1") or build your own custom output format, use the special %-notation. See https://github.com/chubin/wttr.in#one-line-output
headers	{}	Extra Headers
json	False	Is Json?
lang	'en'	Display text language. List of supported languages https://wttr. in/:translation
location	{}	Dictionary. Key is a city or place name, or GPS coordinates. Value is a display name. If the dictionary is empty, the location will be determined based on your IP address.
markup	True	Whether or not to use pango markup
max_chars	0	Maximum number of characters to display in widget.
mouse_callbacks	{}	Dict of mouse button press callback functions. Accepts functions and lazy calls.
padding	None	Padding. Calculated if None.
parse	None	Parse Function
scroll	False	Whether text should be scrolled. When True, you must set the widget's width.
scroll_clear	False	Whether text should scroll completely away (True) or stop when the end of the text is shown (False)
scroll_delay	2	Number of seconds to pause before starting scrolling and restart- ing/clearing text at end
<pre>scroll_fixed_wid</pre>	False	When scroll=True the width parameter is a maximum width and, when text is shorter than this, the widget will resize. Set- ting scroll_fixed_width=True will force the widget to have a fixed width, regardless of the size of the text.
scroll_hide	False	Whether the widget should hide when scrolling has finished
scroll_interval	0.1	Time in seconds before next scrolling step
scroll_repeat	True	Whether text should restart scrolling once the text has ended
scroll_step	1	Number of pixels to scroll with each step
units	'm'	'm' - metric, 'M' - show wind speed in m/s, 'u' - United States units
update_interval	600	Update interval in seconds. Recommendation: if you want to display multiple locations alternately, maybe set a smaller interval, ex. 30.
url	None	Url
user_agent	'Qtile'	Set the user agent
xml	False	Is XML?

## CHAPTER

## TWELVE

## **BUILT-IN HOOKS**

subscribe.addgroup(func)

Called when a new group is added

### Arguments

• name of new group

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.addgroup
def group_added(group_name):
    send_notification("qtile", f"New group added: {group_name}")
```

subscribe.changegroup(func)

Called whenever a group change occurs.

The following changes will result in this hook being fired: 1) New group added (unlike addgroup, no group name is passed with this hook) 2) Group deleted (unlike delgroup, no group name is passed with this hook) 3) Groups order is changed 4) Group is renamed

#### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.changegroup
def change_group():
    send_notification("qtile", "Change group event")
```

#### subscribe.client\_focus(func)

Called whenever focus moves to a client window

#### Arguments

• Window object of the new focus.

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.client_focus
def client_focus(client):
    send_notification("qtile", f"{client.name} has been focused")
```

#### subscribe.client\_killed(func)

Called after a client has been unmanaged

#### Arguments

• Window object of the killed window.

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.client_killed
def client_killed(client):
    send_notification("qtile", f"{client.name} has been killed")
```

#### subscribe.client\_managed(func)

Called after Qtile starts managing a new client

Called after a window is assigned to a group, or when a window is made static. This hook is not called for internal windows.

#### Arguments

• Window object of the managed window

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
Chook.subscribe.client_managed
def client_managed(client):
    send_notification("qtile", f"{client.name} has been managed by qtile")
```

subscribe.client\_mouse\_enter(func)

Called when the mouse enters a client

#### Arguments

• Window of window entered

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.client_killed
def client_mouse_enter(client):
    send_notification("qtile", f"Mouse has entered {client.name}")
```

### subscribe.client\_name\_updated(func)

Called when the client name changes

### Arguments

• Window of client with updated name

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.client_name_updated
def client_name_updated(client):
    send_notification(
        "qtile",
        f"Client's has been updated to {client.name}"
    )
```

### subscribe.client\_new(func)

Called before Qtile starts managing a new client

Use this hook to declare windows static, or add them to a group on startup. This hook is not called for internal windows.

### Arguments

• Window object

Example:

```
from libqtile import hook
@hook.subscribe.client_new
def new_client(client):
    if client.name == "xterm":
        client.togroup("a")
    elif client.name == "dzen":
        client.static(0)
```

subscribe.client\_urgent\_hint\_changed(func)

Called when the client urgent hint changes

### Arguments

• Window of client with hint change

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.client_urgent_hint_changed
def client_urgency_change(client):
    send_notification(
        "qtile",
        f"{client.name} has changed its urgency state"
    )
```

### subscribe.current\_screen\_change(func)

Called when the current screen (i.e. the screen with focus) changes

### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.current_screen_change
def screen_change(event):
    send_notification("qtile", "Current screen change detected.")
```

### subscribe.delgroup(func)

Called when group is deleted

### Arguments

• name of deleted group

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
```

```
@hook.subscribe.delgroup
```

```
def group_deleted(group_name):
    send_notification("qtile", f"Group deleted: {group_name}")
```

### subscribe.enter\_chord(func)

Called when key chord begins

Note: if you only want to use this chord to display the chord name then you should use the Chord widget.

### Arguments

• name of chord(mode)

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.enter_chord
def enter_chord(chord_name):
    send_notification("qtile", "Started {chord_name} key chord.")
```

### subscribe.float\_change(func)

Called when a change in float state is made (e.g. toggle floating, minimised and fullscreen states)

#### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.float_change
def float_change():
    send_notification("qtile", "Window float state changed.")
```

### subscribe.focus\_change(func)

Called when focus is changed, including moving focus between groups or when focus is lost completely (i.e. when a window is closed.)

### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.focus_change
def focus_changed():
    send_notification("qtile", "Focus changed.")
```

#### subscribe.group\_window\_add(func)

Called when a new window is added to a group

#### Arguments

- Group receiving the new window
- Window added to the group

#### Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.group_window_add
def group_window_add(group, window):
    send_notification("qtile", f"Window {window.name} added to {group.name}")
```

### subscribe.layout\_change(func)

Called on layout change event (including when a new group is displayed on the screen)

#### Arguments

- · layout object for new layout
- group object on which layout is changed

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
```

```
@hook.subscribe.layout_change
def layout_change(layout, group):
```

(continues on next page)

(continued from previous page)

```
send_notification(
    "qtile",
    f"{layout.name} is now on group {group.name}"
)
```

### subscribe.leave\_chord(func)

Called when key chord ends

### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
```

```
@hook.subscribe.leave_chord
ded leave_chord():
    send_notification("qtile", "Key chord exited")
```

### subscribe.net\_wm\_icon\_change(func)

Called on \_NET\_WM\_ICON change

X11 only. Called when a window notifies that it has changed its icon.

### Arguments

• Window of client with changed icon

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
Chook.subscribe.net_wm_icon_change
def icon_change(client):
    send_notification("qtile", f"{client.name} has changed its icon")
```

#### subscribe.restart(func)

Called before qtile is restarted.

This hook fires before quile restarts but after quile has checked that it is able to restart (i.e. the config file is valid).

#### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.restart
def run_every_startup():
    send_notification("qtile", "Restarting...")
```

#### subscribe.resume(func)

Called when system wakes up from sleep, suspend or hibernate.

Relies on systemd's inhibitor dbus interface, via the dbus-next package.

Note: the hook is not fired when resuming from shutdown/reboot events. Use the "startup" hooks for those scenarios.

#### Arguments

None

subscribe.screen\_change(func)

Called when the output configuration is changed (e.g. via randr in X11).

**Note:** If you have **reconfigure\_screens** = **True** in your config then qtile will automatically reconfigure your screens when it detects a change to the screen configuration. This hook is fired *before* that reconfiguration takes place. The **screens\_reconfigured** hook should be used where you want to trigger an event after the reconfiguration.

#### Arguments

• xproto.randr.ScreenChangeNotify event (X11) or None (Wayland).

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
Chook.subscribe.screen_change
def screen_change(event):
    send_notification("qtile", "Screen change detected.")
```

### subscribe.screens\_reconfigured(func)

Called once qtile.reconfigure\_screens has completed (e.g. if reconfigure\_screens is set to True in your config).

#### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.screen_change
def screen_change(event):
    send_notification("qtile", "Screens have been reconfigured.")
```

### subscribe.selection\_change(func)

Called on selection change

X11 only. Fired when a selection property is changed (e.g. new selection created or existing selection is emptied)

#### Arguments

· name of the selection

• dictionary describing selection, containing owner and selection as keys

The selection owner will typically be "PRIMARY" when contents is highlighted and "CLIPBOARD" when contents is actively copied to the clipboard, e.g. with Ctrl + C.

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.selection_change
def selection_change(name, selection):
    send_notification(
        "qtile",
        f"Window {selection['owner']} has changed the {name} selection."
    )
```

subscribe.selection\_notify(func)

Called on selection notify

X11 only. Fired when a selection is made in a window.

### Arguments

- name of the selection
- dictionary describing selection, containing owner and selection as keys

The selection owner will typically be "PRIMARY" when contents is highlighted and "CLIPBOARD" when contents is actively copied to the clipboard, e.g. with Ctrl + C.

Example:

```
from libgtile import hook
from libgtile.utils import send_notification
@hook.subscribe.selection_notify
def selection_notify(name, selection):
    send_notification(
        "qtile",
        f"Window {selection['owner']} has made a selection in the {name} selection."
    )
```

### subscribe.setgroup(func)

Called when group is put on screen.

This hook is fired in 3 situations: 1) When the screen changes to a new group 2) When two groups are switched 3) When a screen is focused

#### Arguments

None

Example:

```
from libqtile import hook
from libqtile.utils import send_notification
```

@hook.subscribe.setgroup

(continues on next page)

(continued from previous page)

```
def setgroup():
    send_notification("qtile", "Group set")
```

#### subscribe.shutdown(func)

Called before qtile is shutdown.

Using a long-running command in this function will cause the shutdown to be delayed.

This hook is only fired when qtile is shutting down, if you want a command to be run when the system sleeps then you should use the suspend hook instead.

#### Arguments

None

Example:

```
import os
import subprocess
from libqtile import hook
Chook.subscribe.shutdown
def autostart:
    script = os.path.expanduser("~/.config/qtile/shutdown.sh")
    subprocess.run([script])
```

### subscribe.startup(func)

Called when qtile is started. Unlike startup\_once, this hook is fired on every start, including restarts.

When restarting, this hook is fired after quile has restarted but before quile tries to restore the session to the same state that it was in before the restart.

#### Arguments

None

Example:

### import subprocess

```
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.startup
def run_every_startup():
    send_notification("qtile", "Startup")
```

### subscribe.startup\_complete(func)

Called when quile is started after all resources initialized.

This is the same as startup with the only difference being that this hook is fired after the saved state has been restored.

#### Arguments

None

Example:

```
import subprocess
from libqtile import hook
from libqtile.utils import send_notification
@hook.subscribe.startup_complete
def run_every_startup():
    send_notification("qtile", "Startup complete")
```

### subscribe.startup\_once(func)

Called when Qtile has started on first start

This hook is called exactly once per session (i.e. not on each lazy.restart()).

### Arguments

None

Example:

```
import os
import subprocess
from libqtile import hook
Chook.subscribe.startup_once
def autostart:
    script = os.path.expanduser("~/.config/qtile/autostart.sh")
    subprocess.run([script])
```

### subscribe.suspend(func)

Called when system is about to sleep, suspend or hibernate.

Relies on systemd's inhibitor dbus interface, via the dbus-next package.

When this hook is used, qtile will set an inhibitor that prevent the system from sleeping. The inhibitor is removed as soon as your function exits. You should therefore not use long-running code in this function.

Please note, this inhibitor will also only delay, not block, the computer's ability to sleep. The default delay is 5 seconds. If your function has not completed within that time, the machine will still sleep (see important note below).

You can increase this delay by setting InhibitDelayMaxSec in logind.conf. see: https://www.freedesktop.org/software/systemd/man/logind.conf.html

In addition, closing a laptop lid will ignore inhibitors by default. You can override this by setting LidSwitchIgnoreInhibited=no in /etc/systemd/logind.conf.

**Important:** The logind service creates an inhibitor by passing a reference to a lock file which must be closed to release the lock. Additional references to the lock may be created if you spawn processes with the subprocess module and these processes are running when the machine tries to suspend. As a result, it is strongly recommended that you launch any processes with qtile.spawn(...) as this will not create additional copies of the lock.

### Arguments

None

# Example:

```
from libqtile import hook, qtile
@hook.subscribe.suspend
def lock_on_sleep():
    # Run screen locker
    qtile.spawn("/path/to/screen_locker")
```

# THIRTEEN

# **BUILT-IN EXTENSIONS**

# 13.1 CommandSet

class libqtile.extension.CommandSet(\*\*config)

Give list of commands to be executed in dmenu style.

ex. manage mocp deamon:

ex. CommandSet inside another CommandSet

key	default	description
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
commands	None	dictionary of commands where key is runable command
dmenu_bottom	False	dmenu appears at the bottom of the screen
dmenu_command	'dmenu'	the dmenu command to be launched
dmenu_font	None	override the default 'font' and 'fontsize' options for dmenu
dmenu_height	None	defines the height (only supported by some dmenu forks)
dmenu_ignorecase	False	dmenu matches menu items case insensitively
dmenu_lines	None	dmenu lists items vertically, with the given number of lines
dmenu_prompt	None	defines the prompt to be displayed to the left of the input field
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
pre_commands	None	list of commands to be executed before getting dmenu answer
<pre>selected_backgro</pre>	None	defines the selected background color (#RGB or #RRGGBB)
selected_foregro	None	defines the selected foreground color (#RGB or #RRGGBB)

# 13.2 Dmenu

### class libqtile.extension.Dmenu(\*\*config)

Python wrapper for dmenu http://tools.suckless.org/dmenu/

key	default	description
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
dmenu_bottom	False	dmenu appears at the bottom of the screen
dmenu_command	'dmenu'	the dmenu command to be launched
dmenu_font	None	override the default 'font' and 'fontsize' options for dmenu
dmenu_height	None	defines the height (only supported by some dmenu forks)
dmenu_ignorecase	False	dmenu matches menu items case insensitively
dmenu_lines	None	dmenu lists items vertically, with the given number of lines
dmenu_prompt	None	defines the prompt to be displayed to the left of the input field
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
<pre>selected_backgro</pre>	None	defines the selected background color (#RGB or #RRGGBB)
<pre>selected_foregro</pre>	None	defines the selected foreground color (#RGB or #RRGGBB)

# 13.3 DmenuRun

```
class libqtile.extension.DmenuRun(**config)
```

Special case to run applications.

config.py should have something like:

```
from libqtile import extension
keys = [
    Key(['mod4'], 'r', lazy.run_extension(extension.DmenuRun(
        dmenu_prompt=">",
        dmenu_font="Andika-8",
        background="#15181a",
        foreground="#00ff00",
        selected_background="#079822",
        selected_foreground="#fff",
        dmenu_height=24, # Only supported by some dmenu forks
    ))),
]
```

### **Configuration options**

key	default	description
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
dmenu_bottom	False	dmenu appears at the bottom of the screen
dmenu_command	'dmenu_run'	the dmenu command to be launched
dmenu_font	None	override the default 'font' and 'fontsize' options for dmenu
dmenu_height	None	defines the height (only supported by some dmenu forks)
dmenu_ignorecase	False	dmenu matches menu items case insensitively
dmenu_lines	None	dmenu lists items vertically, with the given number of lines
dmenu_prompt	None	defines the prompt to be displayed to the left of the input field
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
selected_backgro	None	defines the selected background color (#RGB or #RRGGBB)
selected_foregro	None	defines the selected foreground color (#RGB or #RRGGBB)

# 13.4 J4DmenuDesktop

```
class libqtile.extension.J4DmenuDesktop(**config)
```

Python wrapper for j4-dmenu-desktop https://github.com/enkore/j4-dmenu-desktop

key	default	description
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
dmenu_bottom	False	dmenu appears at the bottom of the screen
dmenu_command	'dmenu'	the dmenu command to be launched
dmenu_font	None	override the default 'font' and 'fontsize' options for dmenu
dmenu_height	None	defines the height (only supported by some dmenu forks)
dmenu_ignorecase	False	dmenu matches menu items case insensitively
dmenu_lines	None	dmenu lists items vertically, with the given number of lines
dmenu_prompt	None	defines the prompt to be displayed to the left of the input field
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
j4dmenu_command	'j4-dmenu-deskto	the dmenu command to be launched
j4dmenu_display_	False	display binary name after each entry
j4dmenu_generic	True	include the generic name of desktop entries
j4dmenu_terminal	None	terminal emulator used to start terminal apps
j4dmenu_usage_lc	None	file used to sort items by usage frequency
j4dmenu_use_xdg_	False	read \$XDG_CURRENT_DESKTOP to determine the desktop environment
selected_backgro	None	defines the selected background color (#RGB or #RRGGBB)
selected_foregro	None	defines the selected foreground color (#RGB or #RRGGBB)

# 13.5 RunCommand

### class libqtile.extension.RunCommand(\*\*config)

Run an arbitrary command.

Mostly useful as a superclass for more specific extensions that need to interact with the qtile object.

Also consider simply using lazy.spawn() or writing a client.

key	default	description
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
selected_backgro	None	defines the selected background color (#RGB or #RRGGBB)
selected_foregro	None	defines the selected foreground color (#RGB or #RRGGBB)

# 13.6 WindowList

# class libqtile.extension.WindowList(\*\*config)

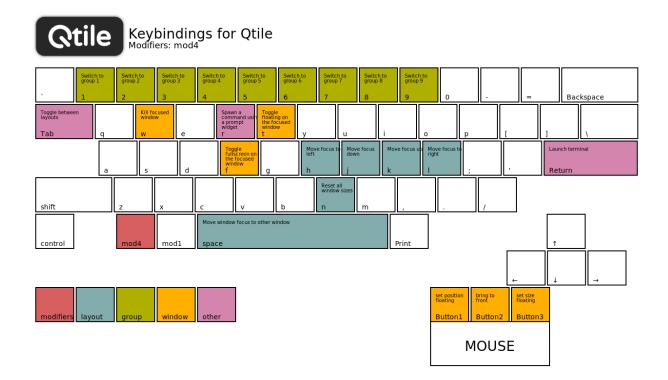

Give vertical list of all open windows in dmenu. Switch to selected.

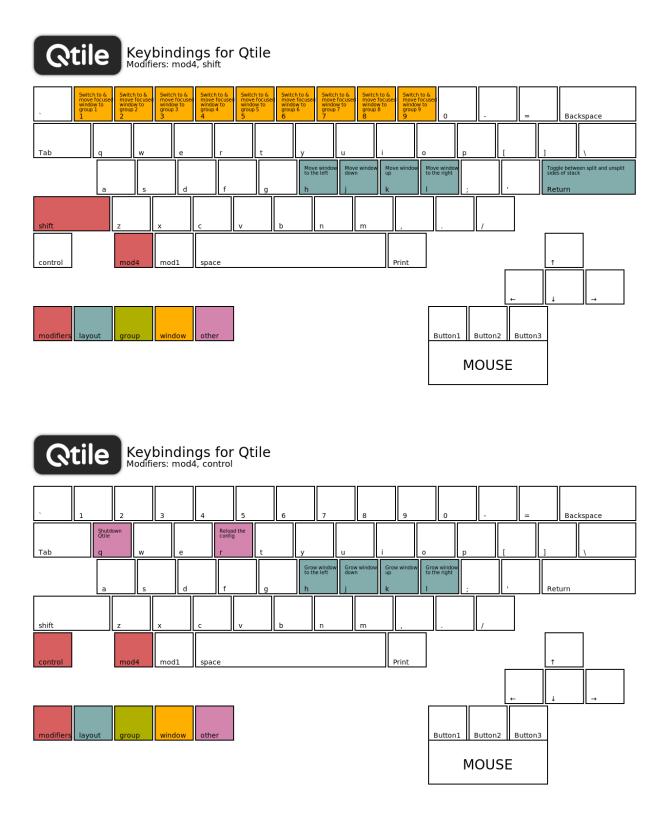

key	default	description
all_groups	True	If True, list windows from all groups; otherwise only from the current group
background	None	defines the normal background color (#RGB or #RRGGBB)
command	None	the command to be launched (string or list with arguments)
dmenu_bottom	False	dmenu appears at the bottom of the screen
dmenu_command	'dmenu'	the dmenu command to be launched
dmenu_font	None	override the default 'font' and 'fontsize' options for dmenu
dmenu_height	None	defines the height (only supported by some dmenu forks)
dmenu_ignorecase	False	dmenu matches menu items case insensitively
dmenu_lines	'80'	Give lines vertically. Set to None get inline
dmenu_prompt	None	defines the prompt to be displayed to the left of the input field
font	'sans'	defines the font name to be used
fontsize	None	defines the font size to be used
foreground	None	defines the normal foreground color (#RGB or #RRGGBB)
item_format	'{group}.{id}: {window}'	the format for the menu items
<pre>selected_backgro</pre>	None	defines the selected background color (#RGB or #RRGGBB)
<pre>selected_foregro</pre>	None	defines the selected foreground color (#RGB or #RRGGBB)

# FOURTEEN

# **KEYBINDINGS IN IMAGES**

# 14.1 Default configuration

# 14.2 Generate your own images

Qtile provides a tiny helper script to generate keybindings images from a config file. In the repository, the script is located under scripts/gen-keybinding-img.

This script accepts a configuration file and an output directory. If no argument is given, the default configuration will be used and files will be placed in same directory where the command has been run.

# FIFTEEN

# WINDOW STACKING

A number of window commands (move\_up/down(), bring\_to\_front() etc.) relate to the stacking order of windows.

The aim of this page is to provide more details as to how stacking is implemented in Qtile.

**Important:** Currently, stacking is only implemented in the X11 background. Support will be added to the Wayland backend in future and this page will be updated accordingly.

# 15.1 Layer priority groups

We have tried to adhere to the EWMH specification. Windows are therefore stacked, from the bottom, according to the following priority rules:

- windows of type \_NET\_WM\_TYPE\_DESKTOP
- windows having state \_NET\_WM\_STATE\_BELOW
- · windows not belonging in any other layer
- windows of type \_NET\_WM\_TYPE\_DOCK (unless they have state \_NET\_WM\_TYPE\_BELOW) and windows having state \_NET\_WM\_STATE\_ABOVE
- focused windows having state \_NET\_WM\_STATE\_FULLSCREEN

Qtile had then added an additional layer so that Scratchpad windows are placed above everything else.

Tiled windows will open in the default, "windows not belonging in any other layer", layer. If floats\_kept\_above is set to True in the config then new floating windows will have the \_NET\_WM\_STATE\_ABOVE property set which will ensure they remain above tiled windows.

# 15.2 Moving windows

Imagine you have four tiled windows stacked (from the top) as follows:

"One" "Two" "Three" "Four"

If you call move\_up() on window "Four", the result will be:

"One" "Two" "Four" "Three"

If you now call move\_to\_top() on window "Three", the result will be:

"Three"	
"One"	
"Two"	
"Four"	

**Note:** bring\_to\_front() has a special behaviour in Qtile. This will bring any window to the very top of the stack, disregarding the priority rules set out above. When that window loses focus, it will be restacked in the appropriate location.

This can cause undesirable results if the config contains bring\_front\_click=True and the user has an app like a dock which is activated by mousing over the window. In this situation, tiled windows will be displayed above the dock making it difficult to activate. To fix this, set bring\_front\_click to False to disable the behaviour completely, or "floating\_only" to only have this behaviour apply to floating windows.

# SIXTEEN

# HACKING ON QTILE

# **16.1 Requirements**

Here are Qtile's additional dependencies that may be required for tests:

Dependency	Ubuntu Package	Needed for
pytest	python3-pytest	Running tests
PyGObject	python3-gi	Running tests (test windows)
Xephyr	xserver-xephyr	Testing with X11 backend (optional, see below)
туру	python3-mypy	Testing qtile check (optional)
imagemagick>=6.8	imagemagick	<pre>test/test_images* (optional)</pre>
gtk-layer-shell	libgtk-layer-shell0	Testing notification windows in Wayland (optional)
dbus-launch	dbus-x11	Testing dbus-using widgets (optional)
notifiy-send	libnotify-bin	Testing Notify widget (optional)
xvfb	xvfb	Testing with X11 headless (optional)

### 16.1.1 Backends

The test suite can be run using the X11 or Wayland backend, or both. By default, only the X11 backend is used for tests. To test a single backend or both backends, specify as arguments to pytest:

pytest --backend wayland # Test just Wayland backend
pytest --backend x11 --backend wayland # Test both

Testing with the X11 backend requires Xephyr (and xvfb for headless mode) in addition to the core dependencies.

# 16.2 Building cffi module

Qtile ships with a small in-tree pangocairo binding built using cffi, pangocffi.py, and also binds to xcursor with cffi. The bindings are not built at run time and will have to be generated manually when the code is downloaded or when any changes are made to the cffi library. This can be done by calling:

./scripts/ffibuild

# 16.3 Setting up the environment

In the root of the project, run ./dev.sh. It will create a virtualenv called venv.

Activate this virtualenv with . venv/bin/activate. Deactivate it with the deactivate command.

# 16.4 Building the documentation

To build the documentation, you will also need to install graphviz. Go into the docs/ directory and run pip install -r requirements.txt. Build the documentation with make html. Check the result by opening \_build/html/index.html in your browser.

Note: To speed up local testing, screenshots are not generated each time the documentation is built.

You can enable screenshots by setting the QTILE\_BUILD\_SCREENSHOTS environmental variable at build time e.g. QTILE\_BUILD\_SCREENSHOTS=1 make html. You can also export the variable so it will apply to all local builds export QTILE\_BUILD\_SCREENSHOTS=1 (but remember to unset it if you want to skip building screenshots).

# 16.5 Development and testing

In practice, the development cycle looks something like this:

- 1. make minor code change
- 2. run appropriate test: pytest tests/test\_module.py or pytest -k PATTERN
- 3. GOTO 1, until hackage is complete
- 4. run entire test suite: pytest
- 5. commit

Of course, your patches should also pass the unit tests as well (i.e. make check). These will be run by ci on every pull request so you can see whether or not your contribution passes.

# 16.6 Coding style

While not all of our code follows PEP8, we do try to adhere to it where possible. All new code should be PEP8 compliant.

The make lint command will run a linter with our configuration over libquile to ensure your patch complies with reasonable formatting constraints. We also request that git commit messages follow the standard format.

# 16.7 Logging

Logs are important to us because they are our best way to see what Qtile is doing when something abnormal happens. However, our goal is not to have as many logs as possible, as this hinders readability. What we want are relevant logs.

To decide which log level to use, refer to the following scenarios:

- ERROR: a problem affects the behavior of Qtile in a way that is noticeable to the end user, and we can't work around it.
- WARNING: a problem causes Qtile to operate in a suboptimal manner.
- INFO: the state of Qtile has changed.
- DEBUG: information is worth giving to help the developer better understand which branch the process is in.

Be careful not to overuse DEBUG and clutter the logs. No information should be duplicated between two messages.

Also, keep in mind that any other level than DEBUG is aimed at users who don't necessarily have advanced programming knowledge; adapt your message accordingly. If it can't make sense to your grandma, it's probably meant to be a DEBUG message.

# **16.8 Deprecation policy**

When a widget API is changed, you should deprecate the change using libqtile.widget.base.deprecated to warn users, in addition to adding it to the appropriate place in the changelog. We will typically remove deprecated APIs one tag after they are deprecated.

# 16.9 Using Xephyr

Qtile has a very extensive test suite, using the Xephyr nested X server. When tests are run, a nested X server with a nested instance of Qtile is fired up, and then tests interact with the Qtile instance through the client API. The fact that we can do this is a great demonstration of just how completely scriptable Qtile is. In fact, Qtile is designed expressly to be scriptable enough to allow unit testing in a nested environment.

The Qtile repo includes a tiny helper script to let you quickly pull up a nested instance of Qtile in Xephyr, using your current configuration. Run it from the top-level of the repository, like this:

```
./scripts/xephyr
```

Change the screen size by setting the SCREEN\_SIZE environment variable. Default: 800x600. Example:

SCREEN\_SIZE=1920x1080 ./scripts/xephyr

Change the log level by setting the LOG\_LEVEL environment variable. Default: INFO. Example:

LOG\_LEVEL=DEBUG ./scripts/xephyr

The script will also pass any additional options to Qtile. For example, you can use a specific configuration file like this:

```
./scripts/xephyr -c ~/.config/qtile/other_config.py
```

Once the Xephyr window is running and focused, you can enable capturing the keyboard shortcuts by hitting Control+Shift. Hitting them again will disable the capture and let you use your personal keyboard shortcuts again. You can close the Xephyr window by enabling the capture of keyboard shortcuts and hit Mod4+Control+Q. Mod4 (or Mod) is usually the Super key (or Windows key). You can also close the Xephyr window by running qtile cmd-obj -o cmd -f shutdown in a terminal (from inside the Xephyr window of course).

You don't need to run the Xephyr script in order to run the tests as the test runner will launch its own Xephyr instances.

# 16.10 Second X Session

Some users prefer to test Qtile in a second, completely separate X session: Just switch to a new tty and run startx normally to use the ~/.xinitrc X startup script.

It's likely though that you want to use a different, customized startup script for testing purposes, for example ~/. config/qtile/xinitrc. You can do so by launching X with:

```
startx ~/.config/qtile/xinitrc
```

startx deals with multiple X sessions automatically. If you want to use xinit instead, you need to first copy /etc/ X11/xinit/xserverrc to ~/.xserverrc; when launching it, you have to specify a new session number:

xinit ~/.config/qtile/xinitrc -- :1

Examples of custom X startup scripts are available in qtile-examples.

# 16.11 Debugging in PyCharm

Make sure to have all the requirements installed and your development environment setup.

PyCharm should automatically detect the venv virtualenv when opening the project. If you are using another viirtualenv, just instruct PyCharm to use it in Settings -> Project: qtile -> Project interpreter.

In the project tree, on the left, right-click on the libqtile folder, and click on Mark Directory as -> Sources Root.

Next, add a Configuration using a Python template with these fields:

- Script path: bin/qtile, or the absolute path to it
- Parameters: -c libqtile/resources/default\_config.py, or nothing if you want to use your own config file in ~/.config/qtile/config.py
- Environment variables: PYTHONUNBUFFERED=1;DISPLAY=:1
- Working directory: the root of the project
- Add contents root to PYTHONPATH: yes
- Add source root to PYTHONPATH: yes

Then, in a terminal, run:

Xephyr +extension RANDR -screen 1920x1040 :1 -ac &

Note that we used the same display, :1, in both the terminal command and the PyCharm configuration environment variables. Feel free to change the screen size to fit your own screen.

Finally, place your breakpoints in the code and click on Debug!

Once you finished debugging, you can close the Xephyr window with kill PID (use the jobs builtin to get its PID).

# 16.12 Debugging in VSCode

Make sure to have all the requirements installed and your development environment setup.

Open the root of the repo in VSCode. If you have created it, VSCode should detect the venv virtualenv, if not, select it.

Create a launch.json file with the following lines.

```
{
    "version": "0.2.0",
    "configurations": [
        {
            "name": "Python: Qtile",
            "type": "python",
            "request": "launch",
            "program": "${workspaceFolder}/bin/qtile",
            "cwd": "${workspaceFolder}",
            "args": ["-c", "libqtile/resources/default_config.py"],
            "console": "integratedTerminal",
            "env": {"PYTHONUNBUFFERED":"1", "DISPLAY":":1"}
        }
    ]
}
```

Then, in a terminal, run:

Xephyr +extension RANDR -screen 1920x1040 :1 -ac &

Note that we used the same display, :1, in both the terminal command and the VSCode configuration environment variables. Then debug usually in VSCode. Feel free to change the screen size to fit your own screen.

# 16.13 Resources

Here are a number of resources that may come in handy:

- Inter-Client Conventions Manual
- Extended Window Manager Hints
- A reasonable basic Xlib Manual

# SEVENTEEN

# CONTRIBUTING

# 17.1 Reporting bugs

Perhaps the easiest way to contribute to Qtile is to report any bugs you run into on the GitHub issue tracker.

Useful bug reports are ones that get bugs fixed. A useful bug report normally has two qualities:

- 1. **Reproducible.** If your bug is not reproducible it will never get fixed. You should clearly mention the steps to reproduce the bug. Do not assume or skip any reproducing step. Describe the issue, step-by-step, so that it is easy to reproduce and fix.
- 2. **Specific.** Do not write an essay about the problem. Be specific and to the point. Try to summarize the problem in a succinct manner. Do not combine multiple problems even if they seem to be similar. Write different reports for each problem.

Ensure to include any appropriate log entries from ~/.local/share/qtile/qtile.log and/or ~/. xsession-errors! Sometimes, an xtrace is requested. If that is the case, refer to *capturing an xtrace*.

# 17.2 Writing code

To get started writing code for Qtile, check out our guide to *Hacking on Qtile*. A more detailed page on creating widgets is available *here*.

**Important:** Use a separate **git branch** to make rebasing easy. Ideally, you would **git checkout** -b <my\_feature\_branch\_name> before starting your work.

See also: using git.

### 17.2.1 Submit a pull request

You've done your hacking and are ready to submit your patch to Qtile. Great! Now it's time to submit a pull request to our issue tracker on GitHub.

Important: Pull requests are not considered complete until they include all of the following:

- Code that conforms to PEP8 and is formatted by black.
- Unit tests that pass locally and in our CI environment (More below). *Please add unit tests* to ensure that your code works and stays working!
- Documentation updates on an as needed basis.

- A qtile migrate migration is required for config-breaking changes. See migrate.py for examples and consult the bowler documentation for detailed help and documentation.
- **Code** that does not include *unrelated changes*. Examples for this are formatting changes, replacing quotes or whitespace in other parts of the code or "fixing" linter warnings popping up in your editor on existing code. *Do not include anything like the above!*
- Widgets don't need to catch their own exceptions, or introduce their own polling infrastructure. The code in libqtile.widget.base.\* does all of this. Your widget should generally only include whatever parsing/rendering code is necessary, any other changes should go at the framework level. Make sure to double-check that you are not re-implementing parts of libqtile.widget.base.
- **Commit messages** are more important that Github PR notes, since this is what people see when they are spelunking via git blame. Please include all relevant detail in the actual git commit message (things like exact stack traces, copy/pastes of discussion in IRC/mailing lists, links to specifications or other API docs are all good). If your PR fixes a Github issue, it might also be wise to link to it with #1234 in the commit message.
- PRs with **multiple commits** should not introduce code in one patch to then change it in a later patch. Please do a patch-by-patch review of your PR, and make sure each commit passes CI and makes logical sense on its own. In other words: *do* introduce your feature in one commit and maybe add the tests and documentation in a seperate commit. *Don't* push commits that partially implement a feature and are basically broken.

**Note:** Others might ban *force-pushes*, we allow them and prefer them over incomplete commits or commits that have a bad and meaningless commit description.

Feel free to add your contribution (no matter how small) to the appropriate place in the CHANGELOG as well!

# 17.2.2 Unit testing

We must test each *unit* of code to ensure that new changes to the code do not break existing functionality. The framework we use to test Qtile is pytest. How pytest works is outside of the scope of this documentation, but there are tutorials online that explain how it is used.

Our tests are written inside the test folder at the top level of the repository. Reading through these, you can get a feel for the approach we take to test a given unit. Most of the tests involve an object called manager. This is the test manager (defined in test/helpers.py), which exposes a command client at manager. c that we use to test a Qtile instance running in a separate thread as if we were using a command client from within a running Qtile session.

For any Qtile-specific question on testing, feel free to ask on our issue tracker or on IRC (#qtile on irc.oftc.net).

# 17.2.3 Running tests locally

This section gives an overview about tox so that you don't have to search its documentation just to get started. Checks are grouped in so-called environments. Some of them are configured to check that the code works (the usual unit test, e.g. py39, pypy3), others make sure that your code conforms to the style guide (pep8, codestyle, mypy). A third kind of test verifies that the documentation and packaging processes work (docs, docstyle, packaging).

### The following examples show how to run tests locally:

• To run the functional tests, use tox -e py39 (or a different environment). You can specify to only run a specific test file or even a specific test within that file with the following commands:

```
tox -e py39 # Run all tests with python 3.9 as the interpreter
tox -e py39 -- -x test/widgets/test_widgetbox.py # run a single file
tox -e py39 -- -x test/widgets/test_widgetbox.py::test_widgetbox_widget
```

• To run style and building checks, use tox -e docs, packaging, pep8,.... You can use -p auto to run the environments in parallel.

**Important:** The CI is configured to run all the environments. Hence it can be time- consuming to make all the tests pass. As stated above, pull requests that don't pass the tests are considered incomplete. Don't forget that this does not only include the functionality, but the style, typing annotations (if necessary) and documentation as well!

EIGHTEEN

# FREQUENTLY ASKED QUESTIONS

# 18.1 Why the name Qtile?

Users often wonder, why the Q? Does it have something to do with Qt? No. Below is an IRC excerpt where cortesi explains the great trial that ultimately brought Qtile into existence, thanks to the benevolence of the Open Source Gods. Praise be to the OSG!

ramnes:	what does Qtile mean?
ramnes:	what's the Q?
@tych0:	ramnes: it doesn't :)
@tych0:	cortesi was just looking for the first letter that wasn't registered
	in a domain name with "tile" as a suffix
@tych0:	qtile it was :)
cortesi:	tych0, dx: we really should have something more compelling to
	explain the name. one day i was swimming at manly beach in sydney,
	where i lived at the time. suddenly, i saw an enormous great white
	right beside me. it went for my leg with massive, gaping jaws, but
	quick as a flash, i thumb-punched it in both eyes. when it reared
	back in agony, i saw that it had a jagged, gnarly scar on its
	stomach a scar shaped like the letter "Q".
cortesi:	while it was distracted, i surfed a wave to shore. i knew that i
	had to dedicate my next open source project to the ocean gods, in
	thanks for my lucky escape. and thus, qtile got its name

# 18.2 When I first start xterm/urxvt/rxvt containing an instance of Vim, I see text and layout corruption. What gives?

Vim is not handling terminal resizes correctly. You can fix the problem by starting your xterm with the "-wf" option, like so:

xterm -wf -e vim

Alternatively, you can just cycle through your layouts a few times, which usually seems to fix it.

# 18.3 How do I know which modifier specification maps to which key?

To see a list of modifier names and their matching keys, use the xmodmap command. On my system, the output looks like this:

```
$ xmodmap
xmodmap: up to 3 keys per modifier, (keycodes in parentheses):
shift
            Shift_L (0x32),
                             Shift_R (0x3e)
lock
            Caps_Lock (0x9)
control
            Control_L (0x25), Control_R (0x69)
mod1
            Alt_L (0x40), Alt_R (0x6c), Meta_L (0xcd)
mod2
            Num_Lock (0x4d)
mod3
mod4
            Super_L (0xce), Hyper_L (0xcf)
mod5
            ISO_Level3_Shift (0x5c), Mode_switch (0xcb)
```

# 18.4 My "pointer mouse cursor" isn't the one I expect it to be!

Qtile should set the default cursor to left\_ptr, you must install xcb-util-cursor if you want support for themed cursors.

# 18.5 LibreOffice menus don't appear or don't stay visible

A workaround for problem with the mouse in libreoffice is setting the environment variable »SAL\_USE\_VCLPLUGIN=gen«. It is dependent on your system configuration as to where to do this. e.g. ArchLinux with libreoffice-fresh in /etc/profile.d/libreoffice-fresh.sh.

# 18.6 How can I get my groups to stick to screens?

This behaviour can be replicated by configuring your keybindings to not move groups between screens. For example if you want groups "1", "2" and "3" on one screen and "q", "w", and "e" on the other, instead of binding keys to lazy.group[name].toscreen(), use this:

```
groups = [
    # Screen affinity here is used to make
    # sure the groups startup on the right screens
    Group(name="1", screen_affinity=0),
    Group(name="2", screen_affinity=0),
    Group(name="3", screen_affinity=0),
    Group(name="q", screen_affinity=1),
    Group(name="w", screen_affinity=1),
    Group(name="e", screen_affinity=1),
]
def go_to_group(name: str) -> Callable:
    def __inner(qtile: Qtile) -> None:
        if len(qtile.screens) == 1:
```

(continues on next page)

(continued from previous page)

```
qtile.groups_map[name].toscreen()
return

if name in '123':
    qtile.focus_screen(0)
    qtile.groups_map[name].toscreen()

else:
    qtile.focus_screen(1)
    qtile.groups_map[name].toscreen()

return _inner

for i in groups:
    keys.append(Key([mod], i.name, lazy.function(go_to_group(i.name))))
```

To be able to move windows across these groups which switching groups, a similar function can be used:

```
def go_to_group_and_move_window(name: str):
    def _inner(qtile):
        if len(qtile.screens) == 1:
            qtile.current_window.togroup(name, switch_group=True)
            return
        if name in "123":
            qtile.current_window.togroup(name, switch_group=False)
            qtile.focus_screen(0)
            qtile.groups_map[name].toscreen()
        else:
            qtile.current_window.togroup(name, switch_group=False)
            qtile.groups_map[name].toscreen()
        else:
            qtile.focus_screen(1)
            qtile.groups_map[name].toscreen()
        return _inner
```

If you use the GroupBox widget you can make it reflect this behaviour:

```
groupbox1 = widget.GroupBox(visible_groups=['1', '2', '3'])
groupbox2 = widget.GroupBox(visible_groups=['q', 'w', 'e'])
```

And if you jump between having single and double screens then modifying the visible groups on the fly may be useful:

```
@hook.subscribe.screens_reconfigured
async def _():
    if len(qtile.screens) > 1:
        groupbox1.visible_groups = ['1', '2', '3']
    else:
        groupbox1.visible_groups = ['1', '2', '3', 'q', 'w', 'e']
    if hasattr(groupbox1, 'bar'):
        groupbox1.bar.draw()
```

# 18.7 Where can I find example configurations and other scripts?

Please visit our qtile-examples repo which contains examples of users' configurations, scripts and other useful links.

# 18.8 Where are the log files for Qtile?

The log files for qtile are at ~/.local/share/qtile/qtile.log.

# 18.9 Why do I get an AttributeError when building Qtile?

If you see this message: AttributeError: cffi library 'libcairo.so.2' has no function, constant or global variable named 'cairo\_xcb\_surface\_create' when building Qtile then your Cairo version lacks XCB support.

If it happens, it might be because the cairocffi and xcffib dependencies were installed in the wrong order.

To fix this:

- 1. uninstall them from your environment: with pip uninstall cairocffi xcffib if using a virtualenv, or with your system package-manager if you installed the development version of Qtile system-wide.
- 2. re-install them sequentially (again, with pip or with your package-manager):

```
pip install xcffib
pip install --no-cache-dir cairocffi
```

See this issue comment for more information.

If you are using your system package-manager and the issue still happens, the packaging of cairocffi might be broken for your distribution. Try to contact the persons responsible for cairocffi's packaging on your distribution, or to install it from the sources with xcffib available.

# 18.10 How can I match the bar with picom?

You can use "QTILE\_INTERNAL: 32c = 1" in your picom.conf to match the bar. This will match all internal Qtile windows, so if you want to avoid that or to target bars individually, you can set a custom property and match that:

```
mybar = Bar(...)
@hook.subscribe.startup
def _():
    mybar.window.set_property("QTILE_BAR", 1, "CARDINAL", 32)
```

This would enable matching on mybar's window using "QTILE\_BAR: 32c = 1". See 2526 and 1515 for more discussion.

## 18.11 Why do get a warning that fonts cannot be loaded?

When installing Qtile on a new system, when running the test suite or the Xephyr script (./scripts/xephyr), you might see errors in the output like the following or similar:

• Xephyr script:

```
xterm: cannot load font "-Misc-Fixed-medium-R-*-*-13-120-75-75-C-120-IS010646-1"
xterm: cannot load font "-misc-fixed-medium-r-semicondensed--13-120-75-75-c-60-
→iso10646-1"
```

• pytest:

```
------ Captured stderr call ------
Warning: Cannot convert string "8x13" to type FontStruct
Warning: Unable to load any usable ISO8859 font
Warning: Unable to load any usable ISO8859 font
Error: Aborting: no font found
------ Captured stderr teardown ------
Qtile exited with exitcode: -9
```

If it happens, it might be because you're missing fonts on your system.

On ArchLinux, you can fix this by installing xorg-fonts-misc:

```
sudo pacman -S xorg-fonts-misc
```

Try to search for "xorg fonts misc" with your distribution name on the internet to find how to install them.

## 18.12 I've upgraded and Qtile's broken. What do I do?

If you've recently upgraded, the first thing to do is check the *changelog* and see if any breaking changes were made.

Next, check your log file (see above) to see if any error messages explain what the problem is.

If you're still stuck, come and ask for help on Discord, IRC or GitHub.

CHAPTER

### NINETEEN

## HOW TO CREATE A WIDGET

The aim of this page is to explain the main components of qtile widgets, how they work, and how you can use them to create your own widgets.

Note: This page is not meant to be an exhaustive summary of everything needed to make a widget.

It is highly recommended that users wishing to create their own widget refer to the source documentation of existing widgets to familiarise themselves with the code.

However, the detail below may prove helpful when read in conjunction with the source code.

### 19.1 What is a widget?

In Qtile, a widget is a small drawing that is displayed on the user's bar. The widget can display text, images and drawings. In addition, the widget can be configured to update based on timers, hooks, dbus\_events etc. and can also respond to mouse events (clicks, scrolls and hover).

## 19.2 Widget base classes

Qtile provides a number of base classes for widgets than can be used to implement commonly required features (e.g. display text).

Your widget should inherit one of these classes. Whichever base class you inherit for your widget, if you override either the \_\_init\_\_ and/or \_configure methods, you should make sure that your widget calls the equivalent method from the superclass.

```
class MyCustomWidget(base._TextBox):
    def __init__(self, **config):
        super().__init__("", **config)
        # My widget's initialisation code here
```

The functions of the various base classes are explained further below.

## 19.2.1 \_Widget

This is the base widget class that defines the core components required for a widget. All other base classes are based off this class.

This is like a blank canvas so you're free to do what you want but you don't have any of the extra functionality provided by the other base classes.

The base.\_Widget class is therefore typically used for widgets that want to draw graphics on the widget as opposed to displaying text.

### 19.2.2 \_TextBox

The base.\_TextBox class builds on the bare widget and adds a drawer.TextLayout which is accessible via the self.layout property. The widget will adjust its size to fit the amount of text to be displayed.

Text can be updated via the self.text property but note that this does not trigger a redrawing of the widget.

Parameters including font, fontsize, fontshadow, padding and foreground (font colour) can be configured. It is recommended not to hard-code these parameters as users may wish to have consistency across units.

## 19.2.3 InLoopPollText

The base.InLoopPollText class builds on the base.\_TextBox by adding a timer to periodically refresh the displayed text.

Widgets using this class should override the poll method to include a function that returns the required text.

**Note:** This loop runs in the event loop so it is important that the poll method does not call some blocking function. If this is required, widgets should inherit the base.ThreadPoolText class (see below).

### **19.2.4 ThreadPoolText**

The base.ThreadPoolText class is very similar to the base.InLoopPollText class. The key difference is that the poll method is run asynchronously and triggers a callback once the function completes. This allows widgets to get text from long-running functions without blocking Qtile.

## 19.3 Mixins

As well as inheriting from one of the base classes above, widgets can also inherit one or more mixins to provide some additional functionality to the widget.

### 19.3.1 PaddingMixin

This provides the padding (x|y|) attributes which can be used to change the appearance of the widget.

If you use this mixin in your widget, you need to add the following line to your \_\_init\_\_ method:

```
self.add_defaults(base.PaddingMixin.defaults)
```

### 19.3.2 MarginMixin

The MarginMixin is essentially effectively exactly the same as the PaddingMixin but, instead, it provides the margin(x|y|) attributes.

As above, if you use this mixin in your widget, you need to add the following line to your \_\_init\_\_ method:

```
self.add_defaults(base.MarginMixin.defaults)
```

## **19.4 Configuration**

Now you know which class to base your widget on, you need to know how the widget gets configured.

### **19.4.1 Defining Parameters**

Each widget will likely have a number of parameters that users can change to customise the look and feel and/or behaviour of the widget for their own needs.

The widget should therefore provide the default values of these parameters as a class attribute called defaults. The format of this attribute is a list of tuples.

```
defaults = [
   ("parameter_name",
    default_parameter_value,
    "Short text explaining what parameter does")
]
```

Users can override the default value when creating their config.py file.

MyCustomWidget(parameter\_name=updated\_value)

Once the widget is initialised, these parameters are available at self.parameter\_name.

### 19.4.2 The \_\_init\_\_ method

Parameters that should not be changed by users can be defined in the \_\_init\_\_ method.

This method is run when the widgets are initially created. This happens before the qtile object is available.

### 19.4.3 The \_configure method

The \_configure method is called by the bar object and sets the self.bar and self.qtile attributes of the widget. It also creates the self.drawer attribute which is necessary for displaying any content.

Once this method has been run, your widget should be ready to display content as the bar will draw once it has finished its configuration.

Calls to methods required to prepare the content for your widget should therefore be made from this method rather than \_\_init\_\_.

## 19.5 Displaying output

A Qtile widget is just a drawing that is displayed at a certain location the user's bar. The widget's job is therefore to create a small drawing surface that can be placed in the appropriate location on the bar.

### 19.5.1 The "draw" method

The draw method is called when the widget needs to update its appearance. This can be triggered by the widget itself (e.g. if the content has changed) or by the bar (e.g. if the bar needs to redraw its entire contents).

This method therefore needs to contain all the relevant code to draw the various components that make up the widget. Examples of displaying text, icons and drawings are set out below.

It is important to note that the bar controls the placing of the widget by assigning the offsetx value (for horizontal positioning) and offsety value (for vertical positioning). Widgets should use this at the end of the draw method. Both offsetx and offsety are required as both values will be set if the bar is drawing a border.

self.drawer.draw(offsetx=self.offsetx, offsety=self.offsety, width=self.width)

**Note:** If you need to trigger a redrawing of your widget, you should call self.draw() if the width of your widget is unchanged. Otherwise you need to call self.bar.draw() as this method means the bar recalculates the position of all widgets.

#### 19.5.2 Displaying text

Text is displayed by using a drawer.TextLayout object. If all you are doing is displaying text then it's highly recommended that you use the `base.\_TextBox superclass as this simplifies adding and updating text.

If you wish to implement this manually then you can create a your own drawer.TextLayout by using the self. drawer.textlayout method of the widget (only available after the *\_configure* method has been run). object to include in your widget.

Some additional formatting of Text can be displayed using pango markup and ensuring the markup parameter is set to True.

```
self.textlayout = self.drawer.textlayout(
    "Text",
    "fffff", # Font colour
    "sans", # Font family
    12, # Font size
```

```
None, # Font shadow
markup=False, # Pango markup (False by default)
wrap=True # Wrap long lines (True by default)
```

### 19.5.3 Displaying icons and images

Qtile provides a helper library to convert images to a surface that can be drawn by the widget. If the images are static then you should only load them once when the widget is configured. Given the small size of the bar, this is most commonly used to draw icons but the same method applies to other images.

```
from libqtile import images
def setup_images(self):
    self.surfaces = {}
   # File names to load (will become keys to the `surfaces` dictionary)
   names = (
        "audio-volume-muted",
        "audio-volume-low",
        "audio-volume-medium",
        "audio-volume-high"
   )
    d_images = images.Loader(self.imagefolder)(*names) # images.Loader can take more_
\rightarrow than one folder as an argument
    for name, img in d_images.items():
        new_height = self.bar.height - 1
        img.resize(height=new_height) # Resize images to fit widget
        self.surfaces[name] = img.pattern # Images added to the `surfaces` dictionary
```

Drawing the image is then just a matter of painting it to the relevant surface:

```
def draw(self):
    self.drawer.ctx.set_source(self.surfaces[img_name]) # Use correct key here for your_
    image
    self.drawer.ctx.paint()
    self.drawer.draw(offsetx=self.offset, width=self.length)
```

### 19.5.4 Drawing shapes

It is possible to draw shapes directly to the widget. The Drawer class (available in your widget after configuration as self.drawer) provides some basic functions rounded\_rectangle, rounded\_fillrect, rectangle and fillrect.

In addition, you can access the Cairo context drawing functions via self.drawer.ctx.

For example, the following code can draw a wifi icon showing signal strength:

```
import math
. . .
def to_rads(self, degrees):
   return degrees * math.pi / 180.0
def draw_wifi(self, percentage):
   WIFI_HEIGHT = 12
   WIFI_ARC_DEGREES = 90
   y_margin = (self.bar.height - WIFI_HEIGHT) / 2
   half_arc = WIFI_ARC_DEGREES / 2
   # Draw grey background
    self.drawer.ctx.new_sub_path()
    self.drawer.ctx.move_to(WIFI_HEIGHT, y_margin + WIFI_HEIGHT)
    self.drawer.ctx.arc(WIFI_HEIGHT,
                        y_margin + WIFI_HEIGHT,
                        WIFI_HEIGHT,
                        self.to_rads(270 - half_arc),
                        self.to_rads(270 + half_arc))
    self.drawer.set_source_rgb("6666666")
    self.drawer.ctx.fill()
   # Draw white section to represent signal strength
    self.drawer.ctx.new_sub_path()
    self.drawer.ctx.move_to(WIFI_HEIGHT, y_margin + WIFI_HEIGHT)
    self.drawer.ctx.arc(WIFI_HEIGHT
                        y_margin + WIFI_HEIGHT,
                        WIFI_HEIGHT * percentage,
                        self.to_rads(270 - half_arc),
                        self.to_rads(270 + half_arc))
    self.drawer.set_source_rgb("ffffff")
    self.drawer.ctx.fill()
```

This creates something looking like this:

#### 19.5.5 Background

At the start of the **draw** method, the widget should clear the drawer by drawing the background. Usually this is done by including the following line at the start of the method:

self.drawer.clear(self.background or self.bar.background)

The background can be a single colour or a list of colours which will result in a linear gradient from top to bottom.

## 19.6 Updating the widget

Widgets will usually need to update their content periodically. There are numerous ways that this can be done. Some of the most common ones are summarised below.

#### 19.6.1 Timers

A non-blocking timer can be called by using the self.timeout\_add method.

self.timeout\_add(delay\_in\_seconds, method\_to\_call, (method\_args))

**Note:** Consider using the ThreadPoolText superclass where you are calling a function repeatedly and displaying its output as text.

#### 19.6.2 Hooks

Qtile has a number of hooks built in which are triggered on certain events.

The WindowCount widget is a good example of using hooks to trigger updates. It includes the following method which is run when the widget is configured:

```
from libqtile import hook
....
def _setup_hooks(self):
    hook.subscribe.client_killed(self._win_killed)
    hook.subscribe.client_managed(self._wincount)
    hook.subscribe.current_screen_change(self._wincount)
    hook.subscribe.setgroup(self._wincount)
```

Read the *Built-in Hooks* page for details of which hooks are available and which arguments are passed to the callback function.

#### 19.6.3 Using dbus

Qtile uses dbus-next for interacting with dbus.

If you just want to listen for signals then Qtile provides a helper method called add\_signal\_receiver which can subscribe to a signal and trigger a callback whenever that signal is broadcast.

**Note:** Qtile uses the asyncio based functions of dbus-next so your widget must make sure, where necessary, calls to dbus are made via coroutines.

There is a \_config\_async coroutine in the base widget class which can be overridden to provide an entry point for asyncio calls in your widget.

For example, the Mpris2 widget uses the following code:

```
from libqtile.utils import add_signal_receiver
....
async def _config_async(self):
    subscribe = await add_signal_receiver(
        self.message, # Callback function
        session_bus=True,
        signal_name="PropertiesChanged",
        bus_name=self.objname,
        path="/org/mpris/MediaPlayer2",
        dbus_interface="org.freedesktop.DBus.Properties")
```

dbus-next can also be used to query properties, call methods etc. on dbus interfaces. Refer to the dbus-next documentation for more information on how to use the module.

### 19.7 Mouse events

By default, widgets handle button presses and will call any function that is bound to the button in the mouse\_callbacks dictionary. The dictionary keys are as follows:

- Button1: Left click
- Button2: Middle click
- Button3: Right click
- Button4: Scroll up
- Button5: Scroll down
- Button6: Scroll left
- Button7: Scroll right

You can then define your button bindings in your widget (e.g. in \_\_init\_\_):

```
class MyWidget(widget.TextBox)
```

```
def __init__(self, *args, **config):
    widget.TextBox.__init__(self, *args, **kwargs)
```

```
self.add_callbacks(
        {
            "Button1": self.left_click_method,
            "Button3": self.right_click_method
        }
)
```

**Note:** As well as functions, you can also bind LazyCall objects to button presses. For example:

```
self.add_callbacks(
    {
        "Button1": lazy.spawn("xterm"),
    }
)
```

In addition to button presses, you can also respond to mouse enter and leave events. For example, to make a clock show a longer date when you put your mouse over it, you can do the following:

```
class MouseOverClock(widget.Clock):
   defaults = \Gamma
        (
            "long_format",
            "%A %d %B %Y | %H:%M",
            "Format to show when mouse is over widget."
        )
   ]
   def __init__(self, **config):
        widget.Clock.__init__(self, **config)
        self.add_defaults(MouseOverClock.defaults)
        self.short_format = self.format
   def mouse_enter(self, *args, **kwargs):
        self.format = self.long_format
        self.bar.draw()
   def mouse_leave(self, *args, **kwargs):
        self.format = self.short_format
        self.bar.draw()
```

## 19.8 Exposing commands to the IPC interface

If you want to control your widget via lazy or scripting commands (such as qtile cmd-obj), you will need to expose the relevant methods in your widget. Exposing commands is done by adding the @expose\_command() decorator to your method. For example:

```
from libqtile.command.base import expose_command
from libqtile.widget import TextBox
```

```
class ExposedWidget(TextBox):
    @expose_command()
    def uppercase(self):
        self.update(self.text.upper())
```

Text in the ExposedWidget can now be made into upper case by calling lazy.widget["exposedwidget"]. uppercase() or qtile cmd-onj -o widget exposedwidget -f uppercase.

If you want to expose a method under multiple names, you can pass these additional names to the decorator. For example, decorating a method with:

```
@expose_command(["extra", "additional"])
def mymethod(self):
    ...
```

will make make the method visible under mymethod, extra and additional.

## 19.9 Debugging

You can use the logger object to record messages in the Qtile log file to help debug your development.

from libqtile.log\_utils import logger
....
logger.debug("Callback function triggered")

**Note:** The default log level for the Qtile log is INFO so you may either want to change this when debugging or use logger.info instead.

Debugging messages should be removed from your code before submitting pull requests.

## 19.10 Submitting the widget to the official repo

The following sections are only relevant for users who wish for their widgets to be submitted as a PR for inclusion in the main Qtile repo.

### 19.10.1 Including the widget in libqtile.widget

You should include your widget in the widgets dict in libqtile.widget.\_\_init\_\_.py. The relevant format is {"ClassName": "modulename"}.

This has a number of benefits:

- · Lazy imports
- Graceful handling of import errors (useful where widget relies on third party modules)
- Inclusion in basic unit testing (see below)

#### 19.10.2 Testing

Any new widgets should include an accompanying unit test.

Basic initialisation and configurations (using defaults) will automatically be tested by test/widgets/ test\_widget\_init\_configure.py if the widget has been included in libqtile.widget.\_\_init\_\_.py (see above).

However, where possible, it is strongly encouraged that widgets include additional unit tests that test specific functionality of the widget (e.g. reaction to hooks).

See Unit testing for more.

#### 19.10.3 Documentation

It is really important that we maintain good documentation for Qtile. Any new widgets must therefore include sufficient documentation in order for users to understand how to use/configure the widget.

The majority of the documentation is generated automatically from your module. The widget's docstring will be used as the description of the widget. Any parameters defined in the widget's defaults attribute will also be displayed. It is essential that there is a clear explanation of each new parameter defined by the widget.

#### Screenshots

While not essential, it is strongly recommended that the documentation includes one or more screenshots.

Screenshots can be generated automatically with a minimal amount of coding by using the fixtures created by Qtile's test suite.

A screenshot file must satisfy the following criteria:

- Be named ss\_[widgetname].py
- Any function that takes a screenshot must be prefixed with ss\_
- Define a pytest fixture named widget

An example screenshot file is below:

```
import pytest
from libqtile.widget import wttr
RESPONSE = "London: +17°C"
```

```
@pytest.fixture
def widget(monkeypatch):
    def result(self):
        return RESPONSE
    monkeypatch.setattr("libqtile.widget.wttr.Wttr.fetch", result)
    yield wttr.Wttr

@pytest.mark.parametrize(
    "screenshot_manager",
    [
        ["location": {"London": "Home"}}]
    ],
    indirect=True
)
def ss_wttr(screenshot_manager):
    screenshot_manager.take_screenshot()
```

The widget fixture returns the widget class (not an instance of the widget). Any monkeypatching of the widget should be included in this fixture.

The screenshot function (here, called ss\_wttr) must take an argument called screenshot\_manager. The function can also be parameterized, in which case, each dict object will be used to configure the widget for the screenshot (and the configuration will be displayed in the docs). If you want to include parameterizations but also want to show the default configuration, you should include an empty dict ({}) as the first object in the list.

Taking a screenshot is then as simple as calling screenshot\_manager.take\_screenshot(). The method can be called multiple times in the same function.

screenshot\_manager.take\_screenshot() only takes a picture of the widget. If you need to take a screenshot of the bar then you need a few extra steps:

```
def ss_bar_screenshot(screenshot_manager):
    # Generate a filename for the screenshot
    target = screenshot_manager.target()
    # Get the bar object
    bar = screenshot_manager.c.bar["top"]
    # Take a screenshot. Will take screenshot of whole bar unless
    # a `width` parameter is set.
    bar.take_screenshot(target, width=width)
```

# 19.11 Getting help

If you still need help with developing your widget then please submit a question in the qtile-dev group or submit an issue on the github page if you believe there's an error in the codebase.

#### CHAPTER

### TWENTY

## **USING** GIT

git is the version control system that is used to manage all of the source code. It is very powerful, but might be frightening at first. This page should give you a quick overview, but for a complete guide you will have to search the web on your own. Another great resource to get started practically without having to try out the newly-learned commands on a pre-existing repository is learn git branching. You should probably learn the basic git vocabulary and then come back to find out how you can use all that practically. This guide will be oriented on how to create a pull request and things might be in a different order compared to the introductory guides.

**Warning:** This guide is not complete and never will be. If something isn't clear, consult other sources until you are confident you know what you are doing.

## 20.1 I want to try out a feature somebody is working on

If you see a pull request on GitHub that you want to try out, have a look at the line where it says:

user wants to merge n commits into qtile:master from user:branch

Right now you probably have one *remote* from which you can fetch changes, the origin. If you cloned qtile/qtile, git remote show origin will spit out the *upstream* url. If you cloned your fork, origin points to it and you probably want to git remote add upstream https://www.github.com/qtile/qtile. To try out somebody's work, you can add their fork as a new remote:

git remote add <user> https://www.github.com/user/qtile

where you fill in the username from the line we asked you to search for before. Then you can load data from that remote with git fetch and then ultimately check out the branch with git checkout <user>/<bra>/<bra>/<bra>/<bra>/<bra>

**Alternatively**, it is also possible to fetch and checkout pull requests without needing to add other remotes. The upstream remote is sufficient:

git fetch upstream pull/<id>/head:pr<id>
git checkout pr<id>

The numeric pull request id can be found in the url or next to the title (preceeded by a # symbol).

**Note:** Having the feature branch checked out doesn't mean that it is installed and will be loaded when you restart qtile. You might still need to install it with pip.

## 20.2 I committed changes and the tests failed

You can easily change your last commit: After you have done your work, git add everything you need and use git commit --amend to change your last commit. This causes the git history of your local clone to be diverged from your fork on GitHub, so you need to force-push your changes with:

git push -f <origin> <feature-branch>

where origin might be your user name or **origin** if you cloned your fork and feature-branch is to be replaced by the name of the branch you are working on.

Assuming the feature branch is currently checked out, you can usually omit it and just specify the origin.

## 20.3 I was told to rebase my work

If *upstream/master* is changed and you happened to change the same files as the commits that were added upstream, you should rebase your work onto the most recent *upstream/master*. Checkout your master, pull from *upstream*, checkout your branch again and then rebase it:

```
git checkout master
git pull upstream/master
git checkout <feature-branch>
git rebase upstream/master
```

You will be asked to solve conflicts where your diff cannot be applied with confidence to the work that was pushed upstream. If that is the case, open the files in your text editor and resolve the conflicts manually. You possibly need to git rebase --continue after you have resolved conflicts for one commit if you are rebasing multiple commits.

Note that the above doesn't work if you didn't create a branch. In that case you will find guides elsewhere to fix this problem, ideally by creating a branch and resetting your master branch to where it should be.

## 20.4 I was told to squash some commits

If you introduce changes in one commit and replace them in another, you are told to squash these changes into one single commit without the intermediate step:

git rebase -i master

opens a text editor with your commits and a comment block reminding you what you can do with your commits. You can reword them to change the commit message, reorder them or choose fixup to squash the changes of a commit into the commit on the line above.

This also changes your git history and you will need to force-push your changes afterwards.

Note that interactive rebasing also allows you to split, reorder and edit commits.

# 20.5 I was told to edit a commit message

If you need to edit the commit message of the last commit you did, use:

#### git commit --amend

to open an editor giving you the possibility to reword the message. If you want to reword the message of an older commit or multiple commits, use git rebase -i as above with the reword command in the editor.

### TWENTYTWO

## CHANGELOG

```
Qtile x.xx.x, released XXXX-XX-XX:
    * features
    * bugfixes
Qtile 0.23.0, released 2023-09-24:
    !!! Dependency Changes !!!
      - xcffib must be upgraded to >= 1.4.0
      - cairocffi must be upgraded to >= 1.6.0
      - New optional dependency `pulsectl-asyncio` required for `PulseVolume` widget
    !!! Notice for packagers - wlroots (optional dependency) bump !!!
      - Qtile's wayland backend now requires on wlroots 0.16 (and pywlroots 0.16)
    !!! config breakage/changes !!!
      - The `cmd_` prefix has been dropped from all commands (this means command names_
\hookrightarrow are common when accessed
        via the command interface or internal python objects).
      - Custom widgets should now expose command methods with the `@expose_command`_
→decorator (available via
        `from libqtile.command.base import expose_command`).
      - Some commands have been renamed (in addition to dropping the 'cmd_' prefix):
          `hints` -> `get_hints`
          `groups` -> `get_groups`
          `screens` -> `get_screens`
      - Layouts need to rename some methods:
        - `add` to `add_client`
        - `cmd_next` to `next`
        - `cmd_previous` to `previous`
      - Layouts or widgets that redefine the `commands` property need to update the.
\rightarrow signature:
           @expose_command()`
          `def commands(self) -> list[str]:`
      - `Window.getsize` has been renamed `Window.get_size` (i.e. merged with the get_
\rightarrow size command).
      - `Window.getposition` has been renamed `Window.get_position` (i.e. merged with_
\rightarrow the get_position command).
      - The `StockTicker` widget `function` option is being deprecated: rename it to...
\rightarrow`func`.
      - The formatting of `NetWidget` has changed, if you use the `format` parameter in_
\rightarrow your config include
        `up_suffix`, `total_suffix` and `down_suffix` to display the respective units.
      - The `Notify` widget now has separate `default_timeout` properties for differenct.
                                                                               (continues on next page)
```

(continued from previous page)  $\rightarrow$  urgency levels. Previously, default\_timeout` was `None` which meant that there was no timeout for all. →notifications (unless this had been set by the client sending the notification). Now, `default\_timeout` is for  $\rightarrow$  normal urgency notifications and this has been set to a default of 10 seconds. `default\_timeout\_urgent`, for critical\_ →notifications, has a timeout of `None`. - The `PulseVolume` widget now depends on a third party library, `pulsectl-→asyncio`, to interact with the pulse audio server. Users will now see an `ImportError` until they install that library. \* features - Add ability to set icon size in `LaunchBar` widget. - Add 'warp\_pointer' option to `Drag` that when set will warp the pointer to the. →bottom right of the window when dragging begins. - Add `currentsong` status to `Mpd2` widget. - Add ability to disable group toggling in `GroupBox` widget - Add ability to have different border color when windows are stacked in Stack  $\rightarrow$ layout. Requires setting `border\_focus\_stack` and `border\_normal\_stack` variables. - Add ability to have different single border width for Columns layout by →setting 'single\_border\_width' key. - Add ability to have different border and margin widths when VerticalTile. →layout only contains 1 window by setting 'single\_border\_width' and 'single\_margin' keys. - New widget: GenPollCommand - Add `format` and `play\_icon` parameters for styling cmus widget. - Add ability to add a group at a specified index - Add ability to spawn the `WidgetBox` widget opened. - Add ability to swap focused window based on index, and change the order of  $\Box$ →windows inside current group - Add ability to update the widget only once if `update\_interval` is None. - Add `move\_to\_slice` command to move current window to single layout in `Slice`\_ ⊣layout - Made the `NetWidget` text formattable. - Qtile no longer floods the log following X server disconnection, instead  $\rightarrow$  handling those errors. - `Key` and `KeyChord` bindings now have another argument `swallow`. It indicates whether or not the pressed keys should be passed on to the  $\hookrightarrow$  focused client. By default the keys are not passed (swallowed), so this argument is set to  $\rightarrow$  `True`. When set to `False`, the keys are passed to the focused client. A key is never →swallowed if the function is not executed, e.g. due to failing the `.when()` check. - Add ability to set custom "Undefined" status key value to `Mpd2Widget`. - `Mpd2Widget` now searches for artist name in all similar keys (i.e. →`albumartist`, `performer`, etc.). - Add svg support to `CustomLayoutIcon` - added layering controls for X11 (Wayland support coming soon!): - `lazy.window.keep\_above()/keep\_below()` marks windows to be kept above/below\_  $\rightarrow$  other windows permanently.

(continued from previous page) Calling the functions with no arguments toggles the state, otherwise pass →`enable=True` or `enable=False`. - `lazy.window.move\_up()/move\_down()` moves windows up and down the z axis. - added `only\_focused` setting to Max layout, allowing to draw multiple\_  $\rightarrow$  clients on top of each other when set to False - Add `suspend` hook to run functions before system goes to sleep. \* bugfixes - Fix bug where Window.center() centers window on the wrong screen when using →multiple monitors. - Fix `Notify` bug when apps close notifications. - Fix `CPU` precision bug with specific version of `psutil` - Fix config being reevaluated twice during reload (e.g. all hooks from config- $\rightarrow$ were doubled) - Fix `PulseVolume` high CPU usage when update\_interval set to 0. - Fix `Battery` widget on FreeBSD without explicit `battery` index given. - Fix XMonad layout faulty call to nonexistent \_shrink\_up - Fix setting tiled position by mouse for layouts using \_SimpleLayoutBase. To\_  $\hookrightarrow$  support this in other layouts, add a swap method taking two windows. - Fix unfullscreening bug in conjunction with Chromium based clients when auto\_  $\rightarrow$  fullscreen is set to `False`. - Ensure `CurrentLayoutIcon` expands paths for custom folders. - Fix vertical alignment of icons in `TaskList` widget - Fix laggy resize/positioning of floating windows in X11 by handling motion →notify events later. We also introduced a cap setting if you want to limit these.  $\rightarrow$ events further, e.g. for limiting resource usage. This is configurable with the x11\_ →drag\_polling\_rate variable for each `Screen` which is set to None by default,  $\rightarrow$  indicating no cap. \* python version support - We have added support for python 3.11 and pypy 3.9. - python 3.7, 3.8 and pypy 3.7 are not longer supported. - Fix bug where `StatusNotifier` does not update icons Qtile 0.22.0, released 2022-09-22: !!! Config breakage !!! - lazy.qtile.display\_kb() no longer receives any arguments. If you passed it any\_  $\rightarrow$  arguments (which were ignored previously), remove them. - If you have a custom startup Python script that you use instead of `qtile\_ →start` and run init\_log manually, the signature has changed. Please check the source for the updated  $\rightarrow$  arguments. - `KeyChord`'s signature has changed. ``mode`` is now a boolean to indicate...  $\rightarrow$  whether the mode should persist. The ``name`` parameter should be used to name the chord (e.g. for the  $\rightarrow$  `Chord`` widget). \* features - Add ability to draw borders and add margins to the `Max` layout. - The default XWayland cursor is now set at startup to left\_ptr, so an xsetroot\_  $\rightarrow$  call is not needed to avoid the ugly X cursor. - Wayland: primary clipboard should now behave same way as with X after (continues on next page)

(continued from previous page) → selecting something it should be copied into clipboard - Add `resume` hook when computer resumes from sleep/suspend/hibernate. - Add `text\_only` option for `LaunchBar` widget. - Add `force\_update` command to `ThreadPoolText` widgets to simplify updating\_  $\rightarrow$  from key bindings - Add scrolling ability to `\_TextBox`-based widgets. - Add player controls (via mouse callbacks) to `Mpris2` widget. - Wayland: input inhibitor protocol support added (pywayland>=0.4.14 & pywlroots>  $\rightarrow = 0.15.19$ - Add commands to control Pomodoro widget. - Add icon theme support to `TaskList` widget (available on X11 and Wayland.  $\rightarrow$  backends). - Wayland: Use `qtile cmd-obj -o core -f get\_inputs` to get input device  $\rightarrow$  identifiers for configuring inputs. Also input configs will be updated by config reloads.  $\rightarrow$  (pywlroots>=0.15.21) \* bugfixes - Widgets that are incompatible with a backend (e.g. Systray on Wayland) will no.  $\rightarrow$  longer show as a ConfigError in the bar. Instead the widget is silently removed from the  $\rightarrow$  bar and a message included in the logs. - Reduce error messages in `StatusNotifier` widget from certain apps. - Reset colours in `Chord` widget - Prevent crash in `LaunchBar` when using SVG icons - Improve scrolling in `Mpris2` widget (options to repeat scrolling etc.) Qtile 0.21.0, released 2022-03-23: \* features - Add `lazy.window.center()` command to center a floating window on the screen. - Wayland: added power-output-management-v1 protocol support, added idle\_  $\rightarrow$  protocol. added idle inhibit protocol - Add MonadThreeCol layout based on XMonad's ThreeColumns. - Add `lazy.screen.set\_wallpaper` command. - Added ability to scale the battery icon's size - Add Spiral layout - Add `toggle` argument to `Window.togroup` with the same functionality as in\_  $\rightarrow$  `Group.toscreen`. - Added `margin\_on\_single` and `border\_on\_single` to Bsp layout \* bugfixes - Fix `Systray` crash on `reconfigure\_screens`. - Fix bug where widgets can't be mirrored in same bar. - Fix various issues with setting fullscreen windows floating and vice versa. - Fix a bug where a .when() check for lazy functions errors out when matching on focused windows when none is focused. By default we do not match on focused.  $\rightarrow$  windows, to change this set `if\_no\_focused` to True. - Widget with duplicate names will be automatically renamed by appending numeric. →suffixes

- Fix resizing of wallpaper when screen scale changes (X11)

(continued from previous page) - Two small bugfixes for `StatusNotifier` - better handling of Ayatana indicators - Fix bug where StatusNotifierItem crashes due to invalid object paths (e.g. →Zoom) Qtile 0.20.0, released 2022-01-24: \* features - Add `place\_right` option in the TreeTab layout to place the tab panel on the  $\rightarrow$ right side - X11: Add support for \_NET\_DESKTOP\_VIEWPORT. E.g. can be used by rofi to map on\_  $\rightarrow$  current output. - Wayland: Bump wlroots version. 0.15.x wlroots and 0.15.2+ pywlroots are.  $\rightarrow$  required. - Add XWayland support to the Wayland backend. XWayland will start up as needed,  $\rightarrow$  if it is installed. \* bugfixes - Remove non-commandable windows from IPC. Fixes bug where IPC would fail when  $\rightarrow$  trying to get info on all windows but Systray has icons (which are non-commandable `\_Window`s.) - Fix bug where bars were not reconfigured correctly when screen layout changes. - Fix a Wayland bug where layer-shell surface like dunst would freeze up and  $\rightarrow$  stop updating. - Change timing of `screens\_reconfigured` hook. Will now be called ONLY if `cmd\_ →reconfigure\_screens` has been called and completed. - Fix order of icons in Systray widget when restarting/reloading config. - Fix rounding error in PulseVolume widget's reported volume. - Fix bug where Volume widget did not load images where `theme\_path` had been\_  $\rightarrow$ set in `widget\_defaults`. - Remove ability to have multiple `Systray` widgets. Additional `Systray`  $\rightarrow$ widgets will result in a ConfigError. - Release notification name from dbus when finalising `Notify` widget. This\_ →allows other notification managers to request the name. - Fix bug where `Battery` widget did not retrieve `background` from `widget\_ →defaults`. - Fix bug where widgets in a `WidgetBox` are rendered on top of bar borders. - Add ability to swap focused window based on index, and change the order of  $\mathbf{J}$ →windows inside current group Qtile 0.19.0, released 2021-12-22: \* features - Add ability to draw borders to the Bar. Can customise size and colour per edge. - Add `StatusNotifier` widget implementing the `StatusNotifierItem`  $\rightarrow$  specification. NB Widget does not provide context menus. - Add `total` bandwidth format value to the Net widget. - Scratchpad groups could be defined as single so that only one of the →scratchpad in the group is visible at a given time. - All scratchpads in a Scratchpad group can be hidden with hide\_all() function. - For saving states of scratchpads during restart, we use wids instead of pids.

(continued from previous page) - Scratchpads can now be defined with an optional matcher to match with window\_ →properties. - `Qtile.cmd\_reload\_config` is added for reloading the config without completely\_  $\rightarrow$  restarting. - Window.cmd\_togroup's argument `groupName` should be changed to `group\_name`. For the time being a log warning is in place and a migration is added. In the future `groupName` will fail. - Add `min/max\_ratio` to Tile layout and fix bug where windows can extend.  $\rightarrow$  offscreen. - Add ability for widget `mouse\_callbacks` to take `lazy` calls (similar to.  $\rightarrow$  keybindings) - Add `aliases` to `lazy.spawncmd()` which takes a dictionary mapping convenient aliases to full command lines. - Add a new 'prefix' option to the net widget to display speeds with a static →unit (e.g. MB). - `lazy.group.toscreen()` now does not toggle groups by default. To get this  $\rightarrow$  behaviour back, use `lazy.group.toscreen(toggle=True)` - Tile layout has new `margin\_on\_single` and `border\_on\_single` option to specify whether to draw margin and border when there is only one window. - Thermal zone widget. - Allow TextBox-based widgets to display in vertical bars. - Added a focused attribute to `lazy.function.when` which can be used to Match →on focused windows. - Allow to update Image widget with update() function by giving a new path. \* bugfixes - Windows are now properly re-ordered in the layouts when toggled on and off ⊣fullscreen Qtile 0.18.1, released 2021-09-16: \* features - All layouts will accept a list of colors for border\_\* options with which they will draw multiple borders on the appropriate windows. Qtile 0.18.0, released 2021-07-04: !!! Config breakage !!! - The `qtile` entry point doesn't run `qtile start` by default anymore - New optional dependency for dbus related features: dbus-next. Replaces previous reliance on dbus/Glib and allows gtile to use async dbus calls within asyncio's eventloop. - widget.BatteryIcon no longer has a fallback text mode; use widget.Battery instead - MonadX layout key new\_at\_current is deprecated, use new\_client\_position. - `libqtile.window` has been moved to `libqtile.backend.x11.window`; a migration\_  $\rightarrow$  has been added for this. !!! deprecation warning !!! - 'main' config functions, deprecated in 0.16.1, will no longer be executed. !!! Notice for packagers - new dependencies !!! - Tests now require the 'dbus-next' python module plus 'dbus-launch' and 'notify-→send' applications \* features

- added transparency in x11 and wayland backends - added measure\_mem and measure\_swap attributes to memory widget to allow user\_  $\rightarrow$ to choose measurement units. - memory widget can now be displayed with decimal values - new "qtile migrate" command, which will attempt to upgrade previous configs to the current version in the case of qtile API breaks. - A new `reconfigure\_screens` config setting. When `True` (default) it hooks `Qtile.reconfigure\_screens` to the `screen\_change` hook, reconfiguring gtile's screens in response to randr events. This removes the need to restart qtile when adding/removing external monitors. - improved key chord / sequence functionality. Leaving a chord with `mode` set brings you to a named mode you activated before, see #2264. A new command, `lazy.ungrab\_all\_chords`, was introduced to return to the root\_  $\rightarrow$  bindings. The `enter\_chord` hook is now always called with a string argument. The third argument to `KeyChord` was renamed from `submapping` to `submapping` \_  $\rightarrow$ (typo fix). - added new argument for CheckUpdates widget: `custom\_command\_modify` which\_  $\rightarrow$  allows user to modify the the line count of the output of `custom\_command` with a lambda function (i.e.  $\rightarrow$  `lambda x: x-3`). Argument defaults to `lambda x: x` and is overridden by `distro` argument's. →internal lambda. - added new argument for the WindowName, WindowTabs and Tasklist widgets: `parse\_  $\rightarrow$ text` which allows users to define a function that takes a window name as an input, modify it in some way →(e.g. str.replace(), str.upper() or regex) and show that modification on screen. - A Wayland backend has been added which can be used by calling `qtile start -b\_  $\rightarrow$ wayland` directly in your TTY. It requires the latest releases of wlroots, python-xkbcommon, pywayland and  $\rightarrow$  pywlroots. It is expected to be unstable so please let us know if you find any bugs! - The 'focus` argument to `Click` and `Drag` objects in your config are no.  $\rightarrow$ longer necessary (and are ignored). Qtile 0.17.0, released 2021-02-13: !!! Python version breakage !!! - Python 3.5 and 3.6 are no longer supported !!! Config breakage !!! - Pacman widget has been removed. Use CheckUpdates instead. - Mpris widget has been removed. Use Mpris2 instead. - property "masterWindows" of Tile layout renamed to master\_length - Match objects now only allow one string argument for their wm name/class/etc. properties. to update your config, do e.g. Group('www', spawn='firefox', layout='xmonad', matches=[Match(wm\_class=['Firefox', 'google-chrome', 'Google-matches=[Match(wm\_class='Firefox'), Match(wm\_class='googlechrome'), Match(wm\_class='Google-chrome')]), - properties wname, wmclass and role of Slice-layout replaced by Match-(continues on next page)

```
type property "match"
       - rules specified in `layout.Floating`'s `float_rules` are now evaluated with
         AND-semantics instead of OR-semantics, i.e. if you specify 2 different
         property rules, both have to match
       - check the new `float_rules` for `floating_layout` in the default config and
         extend your own rules appropriately: some non-configurable auto-floating rules
         were made explicit and added to the default config
       - using `dict`s for `layout.Floating`'s `float_rules` is now deprecated, please
         use `config.Match` objects instead
        - `no_reposition_match` in `layout.Floating` has been removed; use the list of
          `config.Match`-objects `no_reposition_rules` instead
       - Command line has been modernized to a single entry point, the `qtile`
         binary. Translations are below:
               qtile
                         -> qtile start
               qtile-cmd -> qtile cmd-obj
               qtile-run -> qtile run-cmd
               qtile-top -> qtile top
               qshell
                         -> gtile shell
         iqshell and dqtile-cmd are no longer distributed with the
         package, as they were either user or developer scripts. Both are
         still available in the gtile repo in /scripts.
         Running `gtile` without arguments will continue to work for the
         forseeable future, but will be eventually deprecated. qtile prints a
         warning when run in this configuration.
       - Qtile.cmd_focus_by_click is no longer an available command.
       - Qtile.cmd_get_info is no longer an available command.
       - libqtile.command_* has been deprecated, it has been moved to
         libqtile.command.*
       - libqtile.widget.base.ThreadedPollText has been removed; out of tree
         widgets can use ThreadPoolText in the same package instead.
       - the YahooWeather widget was removed since Yahoo retired their free
         tier of the weather API
       - Deprecated hook `window_name_change` got removed, use
         `client_name_updated` instead.
       - show_state attribute from WindowName widget has been removed. Use format_
\rightarrowattribute instead.
               show_state = True -> format = '{state}{name}'
               show_state = False -> format = '{name}'
       - mouse_callbacks no longer receives the gtile object as an argument
         (they receive no arguments); import it via `from libqtile import
         qtile` instead.
   * features
       - new WidgetBox widget
       - new restart and shutdown hooks
       - rules specified in `layout.Floating`'s `float_rules` are now evaluated with
         AND-semantics, allowing for more complex and specific rules
       - Python 3.9 support
       - switch to Github Actions for CI
       - Columns layout has new `margin_on_single` option to specify margin
         size when there is only one window (default -1: use `margin` option).

    new OpenWeather widget to replace YahooWeather
```

```
(continues on next page)
```

- new format attribute for WindowName widget - new max\_chars attribute for WindowName widget - libgtile now exports type information - add a new `qtile check` subcommand, which will check qtile configs for various things: - validates configs against the newly exported type information if mypy is present in the environment - validates that qtile can import the config file (e.g. that syntax is correct, ends in a .py extension, etc.) - validates Key and Mouse mod/keysym arguments are ok. - Columns layout now enables column swapping by using swap\_column\_left and swap\_  $\rightarrow$  column\_right !!! warning !!! - When (re)starting, Qtile passes its state to the new process in a file now, where previously it passed state directly as a string. This fixes a bug where some character encodings (i.e. in group names) were getting messed up in the conversion to/from said string. This change will cause issues if you update Qtile then restart it, causing the running old version to pass state in the previous format to the new process which recognises the new. Qtile 0.16.1, released 2020-08-11: !!! Config breakage !!! - Hooks 'addgroup', 'delgroup' and 'screen\_change' will no longer receive the qtile object as an argument. It can be accessed directly at libgtile.gtile. !!! deprecation warning !!! - defining a main function in your config is deprecated. You should use @hook.subscribe.startup\_complete instead. If you need access to the qtile object, import it from libqtile directly. \* bugfixes - include tests in the release for distros to consume - don't resize Oth screen incorrectly on root ConfigureNotify - expose qtile object as libqtile.qtile (note that we still consider anything not prefixed with cmd\_ to be a private API) - fix transparent borders - MonadTall, MonadWide, and TreeTab now work with Slice Qtile 0.16.0, released 2020-07-20: !!! Config breakage !!! - Imports from libgtile.widget are now made through a function proxy to avoid the side effects of importing all widgets at once. If you subclass a widget in your config, import it from its own module. e.g. from libqtile.widget.pomodoro import Pomodoro \* features - added `guess\_terminal` in utils - added keybinding cheet sheet image generator - custom keyboardlayout display - added native support for key chords - validate config before restart and refuse to restart with a bad config

(continued from previous page) - added a bunch of type annotations to config objects (more to come) - major focus rework; Java-based IDEs such as PyCharm, NetBrains, etc. - fix a bug where spotify (or any window with focus-to=parent) was closed, nothing would be focused and no hotkeys would work - respects window's/user's location setting if present (WM\_SIZE\_HINTS)

- fixed YahooWeather widget for new API

- support windows unsetting the input hint

- fix a bug where \_NET\_WM\_DESKTOPS wasn't correctly updated when switching screens in some cases
- fix a crash in the BSP layout

now focus correctly

- fix a stacktrace when unknown keysyms are encounted
- make qtile --version output more sane
- fix a rendering issue with special characters in window names
- keyboard widget no longer re-sets the keyboard settings every second
- fix qtile-top with the new IPC model
- Image widget respects its background setting now
- correctly re-draw non-focused screens on qtile restart
- fix a crash when decoding images
- fix the .when() constraint for lazy objects

Qtile 0.15.1, released 2020-04-14

\* bugfixes

\* bugfixes

fix qtile reload (it was crashing)

Qtile 0.15.0, released 2020-04-12:

```
!!! Config breakage !!!
```

- removed the mpd widget, which depended on python-mpd.
- the Clock widget now requires pytz to handle timezones that are passed as string
- libqtile.command.Client does not exist anymore and has been
- replaced by libqtile.command\_client.CommandClient
- !!! deprecation warning !!!

```
- libqtile.command.lazy is deprecated in favor of libqtile.lazy.lazy
```

- \* features
  - Python 3.8 support
  - `wallpaper` and `wallpaper\_mode` for screens
  - bars can now have margins
  - `lazy.toscreen` called twice will now toggle the groups (optional with the `toggle` parameter)
  - `lazy.window.togroup` now has `switch\_group` parameter to follow the window to the group it is sent to
  - qtile now copies the default config if the config file does not exist
  - all widgets now use Pango markup by default
  - add an `fmt` option for all textbox widgets
  - new PulseVolume widget for controlling PulseAudio
  - new QuickExit widget, mainly for the default config
  - new non-graph CPU widget
  - KeyboardLayout widget: new `options` parameter
  - CheckUpdates widget: support ArchLinux yay
  - GroupBox widget: new `block\_highlight\_text\_color` parameter

- Mpd2 widget: new `color\_progress` parameter - Maildir widget can now display the inbox grand total - the Net widget can now use bits as unit - Spacer widget: new `background\_color` parameter - More consistent resize behavior in Columns layout - various improvements of the default config - large documentation update and improvements (e.g. widget dependencies) \* bugfixes - qtile binary: don't fail if we can't set the locale - don't print help if qtile-cmd function returns nothing - Monad layout: fix margins when flipped Qtile 0.14.2, released 2019-06-19: \* bugfixes - previous release still exhibited same issues with package data, really fix it this time Qtile 0.14.1, released 2019-06-19: \* bugfixes - properly include png files in the package data to install included icons Qtile 0.14.0, released 2019-06-19: !!! Python version breakage !!! - Python 2 is no longer supported - Python 3.4 and older is no longer supported !!! Config breakage !!! - Many internal things were renamed from camel case to snake case. If your config uses main(), or any lazy.function() invocations that interact directly with the qtile object, you may need to forward port them. Also note that we do \*not\* consider the qtile object to be a stable api, so you will need to continue forward porting these things for future refactorings (for wayland, etc.). A better approach may be to add an upstream API for what you want to do ;) - Maildir's subFolder and maildirPath changed to maildir\_path and sub\_folder. - the graph widget requires the psutil library to be installed \* features - add custom `change\_command` to backlight widget - add CommandSet extension to list available commands - simplify battery monitoring widget interface and add freebsd compatible battery widget implementation - track last known mouse coordinates on the qtile manager - allow configuration of warping behavior in columns layout \* bugfixes - with cursor warp enabled, the cursor is warped on screen change - fix stepping groups to skip the scratch pad group - fix stack layout to properly shuffle - silence errors when unmapping windows Qtile 0.13.0, released 2018-12-23:

<pre>!!! deprecation warning !!!     - wmii layout is deprecated in terms of columns layout, which has the     same behavior with different defaults, see the wmii definition for     more details * features     add svg handling for images     allow addgroup command to set the layout     add command to get current log level     allow groupbox to hide unused groups     add caps lock indicator widget * bugfixes     better shutdown handling     fix clientlist current client tracking     fix typo in up command on ratiotile layout     various fixes to check_update widget     fix 0 case for resize screen</pre>	
<pre>Qtile 0.12.0, released 2018-07-20:     !!! Config breakage !!!     - Tile layout commands up/down/shuffle_up/shuffle_down changed to be     more consistent with other layouts</pre>	
<ul> <li>move qcmd to qtile-cmd because of conflict with renameutils, move dqcmd to dqtile-cmd for symmetry</li> <li>* features</li> </ul>	
<ul> <li>- add `add_after_last` option to Tile layout to add windows to the end of the list.</li> <li>- add new formatting options to TaskList</li> </ul>	
<ul> <li>allow Volume to open app on right click</li> <li>* bugfixes</li> </ul>	
<ul> <li>fix floating of file transfer windows and java drop-downs</li> <li>fix exception when calling `cmd_next` and `cmd_previous` on layout without windows</li> <li>fix caps lock affected behaviour of key bindings</li> </ul>	
<ul> <li>re-create cache dir if it is deleted while qtile is running</li> <li>fix CheckUpdates widget color when no updates</li> </ul>	
<ul> <li>handle cases where BAT_DIR does not exist</li> <li>fix the wallpaper widget when using `wallpaper_command`</li> </ul>	
- fix Tile layout order to not reverse on reset	
<ul> <li>fix calling `focus_previous/next` with no windows</li> <li>fix floating bug is BSP layout</li> </ul>	
Qtile 0.11.1, released 2018-03-01: * bug fix - fixed pip install of qtile	
<pre>Qtile 0.11.0, released 2018-02-28: !!! Completely changed extension configuration, see the documentation !!! !!! `extention` subpackage renamed to `extension` !!! !!! `extentions` configuration variable changed to `extension_defaults` !!! * features</pre>	
- ashell improvements	

(•	continued from previo
- new MonadWide layout - new Bsp layout	
- new pomodoro widget	
<ul> <li>new pomodolo widget</li> <li>new stock ticker widget</li> </ul>	
<pre>- new `client_name_updated` hook</pre>	
- new RunCommand and J4DmenuDesktop extension	
- task list expands to fill space, configurable via `spacing` p	arameter
<pre>- add group.focus_by_name() and group.info_by_name()</pre>	
- add disk usage ratio to df widget	
- allow displayed group name to differ from group name	
- enable custom TaskList icon size	
- add qcmd and dqcmd to extend functionality around qtile.comma	nd
functionality	
- add ScratchPad group that has configurable drop downs	
* bugfixes	
- fix race condition in Window.fullscreen	
<ul> <li>fix for string formatting in qtile_top</li> <li>fix unicode literal in tasklist</li> </ul>	
- move mpris2 initialization out of constructor	
<ul> <li>fix wlan widget variable naming and division</li> </ul>	
- normalize behavior of layouts on various commands	
- add better fallback to default config	
- update btc widget to use coinbase	
- fix cursor warp when using default layout implementation	
<ul> <li>don't crash when using widget with unmet dependencies</li> </ul>	
- fix floating window default location	
Qtile 0.10.7, released 2017-02-14:	
* features	
- new MPD widget, widget.MPD2, based on `mpd2` library	
- add option to ignore duplicates in prompt widget	
- add additional margin options to GroupBox widget	
<ul> <li>add option to ignore mouse wheel to GroupBox widget</li> <li>add `watts` formatting string option to Battery widgets</li> </ul>	
- add volume commands to Volume widget	
- add Window.focus command	
* bugfixes	
- place transient windows in the middle of their parents	
- fix TreeTab layout	
- fix CurrentLayoutIcon in Python 3	
- fix xcb handling for xcffib 0.5.0	
- fix bug in Screen.resize	
- fix Qtile.display_kb command	
Qtile 0.10.6, released 2016-05-24:	
<pre>!!! qsh renamed to qshell !!!</pre>	
This avoids name collision with other packages	
* features	
- Test framework changed to pytest	
- Add `startup_complete` hook * hugfimee	
* bugfixes - Restore dynamic groups on restart	
Restore dynamic groups on restart	

- Correct placement of transient\_for windows - Major bug fixes with floating window handling \* file path changes (XDG Base Directory specification) - the default log file path changed from ~/.gtile.log to ~/.local/share/gtile/gtile.log - the cache directory changed from ~/.cache to ~/.cache/qtile - the prompt widget's history file changed from ~/.qtile\_history to ~/.cache/qtile/prompt\_history Qtile 0.10.5, released 2016-03-06: !!! Python 3.2 support dropped !!! !!! GoogleCalendar widget dropped for KhalCalendar widget !!! !!! qtile-session script removed in favor of qtile script !!! \* features - new Columns layout, composed of dynamic and configurable columns of windows - new iPython kernel for qsh, called iqsh, see docs for installing - new qsh command `display\_kb` to show current key binding - add json interface to IPC server - add commands for resizing MonadTall main panel - wlan widget shows when you are disconnected and uses a configurable format \* bugfixes - fix path handling in PromptWidget - fix KeyboardLayout widget cycling keyboard - properly guard against setting screen to too large screen index Qtile 0.10.4, released 2016-01-19: !!! Config breakage !!! - positional arguments to Slice layout removed, now `side` and `width` must be passed in as keyword arguments \* features add alt coin support to BitcoinTracker widget \* bugfixes - don't use six.moves assignment (fix for >=setuptools-19.3) - improved floating and fullscreen handling - support empty or non-charging secondary battery in BatteryWidget - fix GoogleCalendar widget crash Qtile 0.10.3, released 2015-12-25: \* features - add wmii layout - add BSD support to graph widgets \* bugfixes - fix (some) fullscreen problems - update google calendar widget to latest google api - improve multiple keyboard layout support - fix displaying Systray widget on secondary monitor - fix spawn file descriptor handling in Python 3 - remove duplicate assert code in test\_verticaltile.py - allow padding\_{x,y} and margin\_{x,y} widget attrs to be set to 0

```
Qtile 0.10.2, released 2015-10-19:
    * features

    add gtile-top memory monitoring

        - GroupBox can set visible groups
        - new GroupBox highlighting, line
        - allow window state to be hidden on WindowName widget
        - cmd_togroup can move to current group when None sent
        - added MOC playback widget
        - added memory usage widget
        - log truncation, max log size, and number of log backups configurable
        - add a command to change to specific layout index
          (lazy.to_layout_index(index))
    * bugfixes
        - fixed memory leak in dgroups
        - margin fixes for MonalTall layout

    improved cursor warp

        - remove deprecated imp for Python >= 3.3
        - properly close file for NetGraph
        - fix MondadTall layout grow/shrink secondary panes for Python 2
        - Clock widget uses datetime.now() rather than .fromtimestamp()
        - fix Python 3 compatibility of ThermalSensor widget
        - various Systray fixes, including implementing XEMBED protocol
        - print exception to log during loading config
        - fixed xmonad layout margins between main and secondary panes
        - clear last window name from group widgets when closed
        - add toggleable window border to single xmonad layout
    * config breakage
        - layouts.VerticalTile `windows` is now `clients`

    layouts.VerticalTile focus_next/focus_previous now take a single

          argument, similar to other layouts
Qtile 0.10.1, released 2015-07-08:
    This release fixes a problem that made the PyPI package uninstallable,
   qtile will work with a pip install now
Qtile 0.10.0, released 2015-07-07:
    !!! Config breakage !!!
        - various deprecated commands have been removed:
            Screen.cmd_nextgroup: use cmd_next_group
            Screen.cmd_prevgroup: use cmd_prev_group
            Qtile.cmd_nextlayout: use cmd_next_layout
            Qtile.cmd_prevlayout: use cmd_prev_layout
            Qtile.cmd_to_next_screen: use cmd_next_screen
            Qtile.cmd_to_prev_screen: use cmd_prev_screen
        - Clock widget: remove fmt kwarg, use format kwarg
        - GmailChecker widget: remove settings parameter
        - Maildir widget: remove maildirPath, subFolders, and separator kwargs
    * Dependency updates
        - cffi>=1.1 is now required, along with xcffib>=0.3 and cairocffi>=0.7
          (the cffi 1.0 compatible versions of each)
        - Care must be taken that xcffib is installed *before* cairocffi
    * features
```

- add support for themed cursors using xcb-cursor if available - add CheckUpdate widget, for checking package updates, this deprecates the Pacman widget - add KeyboardKbdd widget, for changing keyboard layouts - add Cmus widget, for showing song playing in cmus - add Wallpaper widget, for showing and cycling wallpaper - add EzConfig classes allowing shortcuts to define key bindings - allow GroupBox urgent highlighting through text - Bar can be placed vertically on sides of screens (widgets must be adapted for vertical viewing) add recognizing brightness keys \* bugfixes - deprecation warnings were not printing to logs, this has been fixed - fix calculation of y property of Gap - fix focus after closing floating windows and floating windows - fix various Python 3 related int/float problems - remember screen focus across restarts - handle length 1 list passed to Drawer.set\_source\_rgb without raising divide by zero error - properly close files opened in Graph widget - handle \_NET\_WM\_STATE\_DEMANDS\_ATTENTION as setting urgency - fix get\_wm\_transient\_for, request WINDOW, not ATOM Qtile 0.9.1, released 2015-02-13: This is primarily a unicode bugfix release for 0.9.0; there were several nits related to the python2/3 unicode conversion that were simply wrong. This release also adds license headers to each file, which is necessary for distro maintainers to package Qtile. \* bugfixes - fix python2's importing of gobject - fix unicode handling in several places Qtile 0.9.0, released 2015-01-20: \* !!! Dependency Changes !!! New dependencies will need to be installed for Qtile to work - drop xpyb for xcffib (XCB bindings) - drop py2cairo for cairocffi (Cairo bindings) - drop PyGTK for asyncio (event loop, pangocairo bindings managed internally) - Qtile still depends on gobject if you want to use anything that uses dbus (e.g. the mpris widgets or the libnotify widget) \* features - add Python 3 and pypy support (made possible by dependency changes) - new layout for vertical monitors - add startup\_once hook, which is called exactly once per session (i.e. it is not called when qtile is restarted via lazy.restart()). This eliminates the need for the execute\_once() function found in lots of user configs. - add a command for showing/hiding the bar (lazy.hide\_show\_bar()) - warn when a widget's dependencies cannot be imported - make qtile.log more useful via better warnings in general, including

deprecation and various other warnings that were previously

```
nonexistent
        - new text-polling widget super classes, which enable easy
          implementation of various widgets that need to poll things outside
          the event loop.
        - add man pages
        - large documentation update, widget/layout documentation is now
          autogenerated from the docstrings
        - new ImapWidget for checking imap mailboxes
    * bugfixes
        - change default wmname to "LG3D" (this prevents some java apps from
         not working out of the box)
        - all code passes flake8
        - default log level is now WARNING
        - all widgets now use our config framework
        - windows with the "About" role float by default
        - got rid of a bunch of unnecessary bare except: clauses
Qtile 0.8.0, released 2014-08-18:
    * features
        - massive widget/layout documentation update
        - new widget debuginfo for use in Qtile development
        - stack has new autosplit, fair options
        - matrix, ratiotile, stack, xmonad, zoomy get 'margin' option
        - new launchbar widget
        - support for matching WM_CLASS and pid in Match
        - add support for adding dgroups rules dynamically and via ipc
        - Clock supports non-system timezones
        - new mpris2 widget
        - volume widget can use emoji instead of numbers
        - add an 'eval' function to qsh at every object level
        - bar gradients support more colors
        - new Clipboard widget (very handy!)
    * bugfixes
        - bitcoin ticker widget switched from MtGox (dead) to btc-e
        - all widgets now use Qtile's defaults system, so their defaults are
          settable globally, etc.
        - fix behavior when screens are cloned
        - all widgets use a unified polling framework
        - "dialog" WM_TYPEs float by default
        - respect xrandr --primary
        - use a consistent font size in the default config
        - default config supports mouse movements and floating
        - fix a bug where the bar was not redrawn correctly in some multiscreen
          environments
        - add travis-ci support and make tests vastly more robust
    * config breakage
        - libqtile.layout.Stack's `stacks` parameter is now `num_stacks`
Qtile 0.7.0, released 2014-03-30:
    * features
        - new disk free percentage widget
        - new widget to display static image
```

```
- per core CPU graphs
        - add "screen affinity" in dynamic groups
        - volume widget changes volume linear-ly instead of log-ly
        - only draw bar when idle, vastly reducing the number of bar draws and
          speeding things up
        - new Gmail widget
        - Tile now supports automatically managing master windows via the
          `master_match` parameter.
        - include support for minimum height, width, size increment hints
    * bugfixes
        - don't crash on any exception in main loop
        - don't crash on exceptions in hooks
        - fix a ZeroDivisionError in CPU graph
        - remove a lot of duplicate and unused code
        - Steam windows are placed more correctly
        - Fixed several crashes in gsh
        - performance improvements for some layouts
        - keyboard layout widget behaves better with multiple keyboard
          configurations
    * config breakage
        - Tile's shuffleMatch is renamed to resetMaster
Qtile 0.6, released 2013-05-11:
   !!! Config breakage !!!
   This release breaks your config file in several ways:
        - The Textbox widget no longer takes a ``name'' positional parameter,
          since it was redundant; you can use the ``name'' kwarg to define it.
        - manager.Group (now _Group) is not used to configure groups any more;
          config.Group replaces it. For simple configurations (i.e.
          Group("a") type configs), this should be a drop in replacement.
          config.Group also provides many more options for showing and hiding
          groups, assigning windows to groups by default, etc.
        - The Key, Screen, Drag, and Click objects have moved from the manager
          module to the config module.
        - The Match object has moved from the dgroups module to the config
          module.
        - The addgroup hook now takes two parameters: the qtile object and the
          name of the group added:
              @hook.subscribe
              def addgroup_hook(qtile, name):
                  pass
        - The nextgroup and prevgroup commands are now on Screen instead of
          Group.
   For most people, you should be able to just:
        sed -i -e 's/libgtile.manager/libgtile.config' config.py
    ...dgroups users will need to go to a bit more work, but hopefully
    configuration will be much simpler now for new users.
    * features
        - New widgets: task list,
        - New layout: Matrix
        - Added ability to drag and drop groups on GroupBox
        - added "next urgent window" command
```

```
(continues on next page)
```

```
- added font shadowing on widgets
        - maildir widget supports multiple folders
        - new config option log_level to set logging level (any of
          logging.{DEBUG, INFO, WARNING, ERROR, CRITICAL})
        - add option to battery widget to hide while level is above a certain
          amount
        - vastly simplify configuration of dynamic groups
        - MPD widget now supports lots of metadata options
    * bugfixes
        - don't crash on restart when the config has errors
        - save layout and selected group state on restart
        - varous EWMH properties implemented correctly
        - fix non-black systray icon backgrounds
        - drastically reduce the number of timeout_add calls in most widgets
        - restart on RandR attach events to allow for new screens
        - log level defaults to ERROR
        - default config options are no longer initialized when users define
          their corresponding option (preventing duplicate widgets, etc.)
        - don't try to load config in qsh (not used)
        - fix font alignment across Textbox based widgets
Qtile 0.5, released 2012-11-11:
    (Note, this is not complete! Many, many changes have gone in to 0.5, by a
   large number of contributors. Thanks to everyone who reported a bug or
    fixed one!)
    * features
        - Test framework is now nose
        - Documentation is now in sphinx
        - Several install guides for various OSes
        - New widgets: battery based icon, MPRIS1, canto, current layout, yahoo
          weather, sensors, screen brightness, notifiy, pacman, windowtabs,
          she, crashme, wifi.

    Several improvements to old widgets (e.g. battery widget displays low

          battery in red, GroupBox now has a better indication of which screen
          has focus in multi-screen setups, improvements to Prompt, etc.)
        - Desktop notification service.
        - More sane way to handle configuration files
        - Promote dgroups to a first class entity in libgtile
        - Allow layouts to be named on an instance level, so you can:
            layouts = [
                # a layout just for gimp
                layout.Slice('left', 192, name='gimp', role='gimp-toolbox',
                    fallback=layout.Slice('right', 256, role='gimp-dock',
                    fallback=layout.Stack(stacks=1, **border_args)))
            ]
            . . .
            dynamic_groups = { 'gimp': {'layout': 'gimp'} }
            Dgroups(..., dynamic_groups, ...)
        - New Layout: Zoomy

    Add a session manager to re-exec gtile if things go south
```

- Support for WM\_TAKE\_FOCUS protocol - Basic .desktop file for support in login managers - Qsh reconnects after qtile is restarted from within it - Textbox supports pango markup - Examples moved to qtile-examples repository. \* bugfixes - Fix several classes of X races in a more sane way - Minor typo fixes to most widgets - Fix several crashes when drawing systray icons too early - Create directories for qtile socket as necessary - PEP8 formatting updates (though we're not totally there yet) - All unit tests pass - Lots of bugfixes to MonadTall - Create IPC socket directory if necessary - Better error if two widgets have STRETCH length - Autofloat window classes can now be overridden - xkeysyms updated # vim :set ts=4 sw=4 sts=4 et :
